

Supplementary material. Time course of giant unilamellar vesicles (GUVs) disruption. This graphic shows the percentage (%) of GUVs composed with POPC:POPG:ergosterol (33:33:33 mol%) that remained intact after one hour of incubation with crotonamine [2 μ M]. This assay was performed by continuous observation, under 10 \times objective that allows observing a larger number of GUVs at the same time. Each experiment was performed in triplicate such that the behavior of *circa* of 100 GUVs was followed for each membrane composition. The error bars correspond to the mean deviation of the three independent experiments.
