## 1. Synthesis of starting materials.

### 1.1. Generalities

Reactions were performed in air (unless otherwise stated) and solvents were dispensed from a solvent purification system. Bis-(pinacolato)diboron was used as received. Pinacolborane was used as received and stored at $-20^{\circ} \mathrm{C}$ under argon. NHC-Cu complexes ${ }^{[1]}$ and $\left[\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}\right]$ ${ }^{[2]}$ were synthesized according to published procedures. Internal alkynes were used as received or prepared according to literature procedures. ${ }^{[3] 1} \mathrm{H}$ and ${ }^{13} \mathrm{C}-\left\{{ }^{1} \mathrm{H}\right\}$ Nuclear Magnetic Resonance (NMR) spectra were recorded on a Bruker AVANCE 400 Ultrashield spectrometer or on a Bruker AVANCE 300 spectrometer using the residual solvent peak as reference $\left(\mathrm{CDCl}_{3}: \delta_{\mathrm{H}}=7.26 \mathrm{ppm}, \delta_{\mathrm{C}}=77.16 \mathrm{ppm}\right)$ at 298 K . Gas chromatography $(\mathrm{GC})$ analyses were performed on an Agilent 7890A apparatus equipped with a flame ionization detector and a (5\%-Phenyl)-methylpolysiloxane column ( $30 \mathrm{~m}, 320 \mu \mathrm{~m}$, film: $0.25 \mu \mathrm{~m}$ ). Flash chromatography was performed on silica gel $60 \AA$ pore diameter and $40-63 \mu \mathrm{~m}$ particle size. Elemental analyses were performed at London Metropolitan University Service 166-220 Holloway Road, London, N7 8DB. Mass spectroscopy was performed by the EPSRC National Mass Spectrometry Service Centre at Swansea University, Grove Building, Singleton Park, Swansea, SA2 8PP, Wales, UK.

### 1.2. Synthesis of internal alkynes 5-9

$\left[\mathrm{Pd}(\mathrm{Cl})_{2}\left(\mathrm{PPh}_{3}\right)_{2}\right]$ was synthesized according to a published procedure. ${ }^{[2]}$ Alkynes 5, 7, 8, 9 were synthesised according to a general procedure shown below. $\mathbf{6}$ was synthesised according to a similar method of the literature. ${ }^{[3]}$

A Schlenk flask was charged with THF ( 20 mL ), triethylamine ( 10 mL ), aryl iodide, alkyne, $\left[\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}\right]$ and CuI . The reaction mixture was stirred overnight at the indicated temperature, allowed to cool to rt and quenched with $\mathrm{MeOH}(10 \mathrm{~mL})$. The solution was concentrated in vacuo and $\mathrm{Et}_{2} \mathrm{O}(100 \mathrm{~mL})$ was added. After filtration, the filtrate was washed with $1 \mathrm{NHCl}_{(\mathrm{aq} .)}$ and $\mathrm{H}_{2} \mathrm{O}$. The organic layer was dried over $\mathrm{MgSO}_{4}$, filtered and the solvent was removed in vacuo. The crude product was purified by column chromatography $\left(\mathrm{SiO}_{2}\right)$.

## 2. General procedure for the $\boldsymbol{\beta}$-hydroboration of internal alkynes.

### 2.1. Procedure for Table 1.

In a glovebox, a vial was charged with the Cu catalyst, the base ( 0.2 mmol ), bis(pinacolato)diboron ( $2.2 \mathrm{mmol}, 0.558 \mathrm{~g}, 1.1$ equiv.), 1-phenyl-1-butyne 1 ( $2.0 \mathrm{mmol}, 0.284$ $\mathrm{mL})$, the solvent ( 2.4 mL ) and $\mathrm{MeOH}(0.180 \mathrm{~mL}, 2$ equiv.). At low catalyst loading, a stock solution of Cu was prepared $\left(0.005 \mathrm{mmol}\right.$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3.3 \mathrm{~mL})$ ). $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was removed in vacuo before addition of the other reagents. The reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 16 h under inert atmosphere. The conversion was determined by GC. The volatiles were removed in vacuo and the products were obtained after purification by column chromatography $\left(\mathrm{SiO}_{2}\right)$. The regioselectivity of the reaction was determined by ${ }^{1} \mathrm{H}$ NMR.

### 2.2. General procedure for Table 2.

Catalysts and reagents were stored in air. A vial was charged in air with the Cu catalyst (stock solution 0.005 mmol in 3.3 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The latter was evaporated in vacuo before addition of the other reagents), the base ( 0.2 mmol ), bis-(pinacolato)diboron ( $2.2 \mathrm{mmol}, 0.558 \mathrm{~g}, 1.1$ equiv.), 1-phenyl-1-butyne $\mathbf{1}(2.0 \mathrm{mmol}, 0.284 \mathrm{~mL})$, the solvent $(2.4 \mathrm{~mL})$ and $\mathrm{MeOH}(0.180$ $\mathrm{mL}, 2$ equiv.). The vial was closed with a screw-cap, and the reaction mixture was stirred at $25^{\circ} \mathrm{C}$ for 16 h . The conversion was determined by GC analysis. The volatiles were removed in vacuo and the products were purified by column chromatography $\left(\mathrm{SiO}_{2}\right)$. The regioselectivity of the reactions were determined by ${ }^{1} \mathrm{H}$ NMR.

A vial was charged in air with [ $\mathrm{Cu}(\mathrm{Cl})(\mathrm{IMes})]$, $\mathrm{NaO} t \mathrm{Bu}$, bis-(pinacolato)diboron, 1-phenyl-1-butyne $\mathbf{1}(0.5 \mathrm{mmol}, 0.071 \mathrm{~mL})$, CPME ( 1.4 mL ) and MeI. The vial was closed with a screw-cap, and the reaction mixture was stirred at $60^{\circ} \mathrm{C}$ for 24 h . The conversion was determined by GC analysis using an aliquot of the crude mixture. The volatiles were then removed in vacuo and the products were purified by column chromatography $\left(\mathrm{SiO}_{2}\right)$. The regioselectivity of the product was determined by ${ }^{1} \mathrm{H}$ NMR.

## 4. General procedure for $\boldsymbol{\alpha}$-hydroboration of internal alkynes

### 4.1.General procedure for Table 4.

In a glovebox, a vial was charged with the Cu catalyst, the base, 1-phenyl-1-butyne 1 ( 0.50 $\mathrm{mmol}, 0.071 \mathrm{~mL})$ and the solvent $(0.6 \mathrm{~mL})$. The reaction mixture was stirred for 5 minutes at RT, cooled down to $-30^{\circ} \mathrm{C}$ and then pinacolborane $\mathrm{HB}(\mathrm{pin})$ was added slowly $(0.75 \mathrm{mmol}$, $0.11 \mathrm{~mL}, 1.5$ equiv.). The reaction mixture was allowed to warm up to RT for 20 h under inert atmosphere. The conversion was determined by GC analysis using an aliquot of the crude mixture. The volatiles were then removed in vacuo and the products were purified by column chromatography $\left(\mathrm{SiO}_{2}\right)$. The regioselectivity and the $(\alpha: \beta)$ ratio of the products were determined by ${ }^{1} \mathrm{H}$ NMR.

### 4.2. General procedure for Table 5.

The vial was closed with a screw-cap, and the reaction mixture was stirred at the required temperature for 20 h . The conversion was determined by GC analysis using an aliquot of the crude mixture. The volatiles were then removed in vacuo and the products were purified by column chromatography $\left(\mathrm{SiO}_{2}\right)$. The regioselectivity and the $(\alpha: \beta)$ ratio of the products were determined by ${ }^{1} \mathrm{H}$ NMR.

### 4.3. General procedure for Scheme 6.

Catalysts and reagents were stored in air, with the exception of $\mathrm{HB}(\mathrm{pin})$ which was kept under argon to avoid decomposition. A vial was charged in air with $[\mathrm{Cu}(\mathrm{Cl})(\mathrm{IMes})], \mathrm{NaOH}$ ( $2.5 \mathrm{mg}, 12 \mathrm{~mol} \%$ ), alkyne ( 0.50 mmol ) and CPME ( 0.6 mL ). The mixture was stirred for 5 minutes, cooled down to $-30^{\circ} \mathrm{C}$ and then pinacolborane $\mathrm{HB}(\mathrm{pin})$ was added slowly $(0.75$ $\mathrm{mmol}, 0.11 \mathrm{~mL}, 1.5$ equiv.). The vial was closed with a screw-cap and the reaction mixture was stirred at $80^{\circ} \mathrm{C}$ for 20 h . The conversion was determined by GC analysis using an aliquot of the crude mixture. The volatiles were then removed in vacuo and the products were purified by column chromatography $\left(\mathrm{SiO}_{2}\right)$. The regioselectivity and the $(\alpha: \beta)$ ratio of the products were determined by ${ }^{1} \mathrm{H}$ NMR.
