## Supporting Information

General Information: Starting materials, reagents, and solvents were purchased from commercial sources and used as received unless stated otherwise. Pyrrolidine, piperidine, benzaldehyde, mesitaldehyde, 1-methylindole, 2,4-dimethylphenol, pyrroles and 2-ethylhexanoic acid (2-EHA) were distilled prior to use. 4-Chlorophenol and 2-methylindole were purified by Kugelrohr distillation. 2-Naphthol, 4-t-butylphenol, benzoic acid and 4-(dimethylamino)benzoic acid were recrystallized from toluene/ethanol. Purification of reaction products was carried out by flash column chromatography using Sorbent Technologies Standard Grade silica gel ( $60 \AA, 230-400$ mesh). Analytical thin layer chromatography was performed on EM Reagent 0.25 mm silica gel $60 \mathrm{~F}_{254}$ plates. Visualization was accomplished with UV light or Dragendorff-Munier stains, followed by heating. Melting points were recorded on a Thomas Hoover capillary melting point apparatus and are uncorrected. Infrared spectra were recorded on an ATI Mattson Genesis Series FT-Infrared spectrophotometer. Proton nuclear magnetic resonance spectra ( ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ) were recorded on a Varian VNMRS-500 MHz or Varian VNMRS- 400 MHz and chemical shifts are reported in ppm using the solvent as an internal standard $\left(\mathrm{CDCl}_{3}\right.$ at 7.26 $\mathrm{ppm})$. Data are reported as $\mathrm{app}=$ apparent, $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{m}=$ multiplet, comp $=$ complex, $\mathrm{br}=$ broad; coupling constant(s) in Hz. Proton-decoupled carbon nuclear magnetic resonance spectra ( ${ }^{13} \mathrm{C}-\mathrm{NMR}$ ) spectra were recorded on a Varian VNMRS-500 MHz or Varian VNMRS- 400 MHz and chemical shifts are reported in ppm using the solvent as an internal standard $\left(\mathrm{CDCl}_{3}\right.$ at 77.0 ppm$)$. Mass spectra were recorded on a Finnigan LCQ-DUO mass spectrometer. Arylation products $\mathbf{2 c}, \mathbf{2 e}, \mathbf{5 c}$ and $\mathbf{5 e}$ were previously reported and their published characterization data matched our own in all respects. ${ }^{1-4}$ Ratios of regioisomeric products were determined by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis of the crude reaction mixture.

## General Procedure for the Redox-Neutral $\alpha$-Arylation of Amines with Naphthols or Phenols as Nucleophiles:

To a solution of the naphthol ( $1.5 \mathrm{mmol}, 1.5$ equiv) or phenol ( 5 mmol , 5 equiv) in toluene ( 4 mL ) was added the amine ( $1.5 \mathrm{mmol}, 1.5$ equiv). The mixture was heated under reflux and aldehyde ( $1 \mathrm{mmol}, 1$ equiv, 1 M solution in toluene) was delivered through the top of the reflux condenser over 5 hours via syringe pump. Subsequently, the reaction mixture was allowed to cool to room temperature and the solvent was removed under reduced pressure. The residue was purified by silica gel chromatography.

## General Procedure for the Redox-Neutral $\alpha$-Arylation of Amines with Indoles or Pyrroles as Nucleophiles:

To a solution of the indole ( $1.5 \mathrm{mmol}, 1.5$ equiv) or pyrrole ( 5 mmol , 5 equiv) in toluene ( 4 mL ) was added the amine ( $1.5 \mathrm{mmol}, 1.5$ equiv) and 2-ethylhexanoic acid ( $1 \mathrm{mmol}, 1$ equiv). ${ }^{5}$ The mixture was heated under reflux and aldehyde ( $1 \mathrm{mmol}, 1$ equiv, 1 M solution in toluene) was delivered through the top of the reflux condenser over 5 hours via syringe pump. Subsequently, the reaction mixture was allowed to cool to room temperature, diluted with EtOAc ( 10 mL ) and washed with saturated aqueous $\mathrm{NaHCO}_{3}$ ( 3 x 10 mL ). The combined aqueous layer was extracted with $\mathrm{EtOAc}(3 \times 10 \mathrm{~mL})$ and the combined organic layer was washed with water ( 40 mL ), brine ( 40 mL ), and dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Solvent was then removed under reduced pressure. The residue was purified by silica gel chromatography.
