Figure S1.- Temperature dependence of in-phase  $\chi'_M$  (left) and out-of-phase  $\chi''_M$  (right) components of the *ac* susceptibility for complex 8 measured under zero applied *dc* field.

Figure S2.- Variable-temperature frequency dependence of the  $\chi_M''$  signal for **5** in a 1000 Oe *dc* field. Solid lines represent the best fit to the Debye model (left top). Arrhenius plots for **5** (left down) and for **3** (right, down).

Figure S3.- Variable-temperature frequency dependence of the  $\chi_M''$  signal for **2** (left top) and **8** (right top) in a 1000 Oe *dc* field. Solid lines represent the best fit to the Debye model. Arrhenius plots for **2** (left down) and for **8** (right down).

Figure S4.- Cole-Cole plots for **3** (left top), **5**(left down), **2** (right top) and **8** (right down)

Figure S8.- Temperature dependence of the  $\chi_M T$  product for complexes **2**, **3**, **5** and **8**.

The room temperature  $\chi_M T$  values of  $\text{Dy}^{\text{III}}$  complexes **2** and **8** are  $13.88 \text{ cm}^3 \text{ mol}^{-1} \text{K}$  and  $14.32 \text{ cm}^3 \text{ mol}^{-1} \text{K}$ , respectively, which are in rather good agreement with the expected

theoretical value using the free ion approximation ( $14.17 \text{ cm}^3\text{mol}^{-1}\text{K}$ ) for one isolated  $\text{Dy}^{\text{III}}$  ion, ( $^6\text{H}_{15/2}$ ,  $S = 5/2$ ,  $L = 5$ ,  $g = 4/3$ ). The  $\chi T$  product for **2** and **8** steadily decreases with decreasing temperature to reach minimum values of  $10.50 \text{ cm}^3\text{mol}^{-1}\text{K}$  and  $11.04 \text{ cm}^3\text{mol}^{-1}\text{K}$ , respectively, at 2 K. The room temperature  $\chi_{\text{M}}T$  values of  $\text{Er}^{\text{III}}$  complexes **3** and **5** are  $11.41 \text{ cm}^3 \text{ mol}^{-1}\text{K}$  and  $11.29 \text{ cm}^3 \text{ mol}^{-1}\text{K}$ , respectively, which are close to the expected theoretical value using the free ion approximation ( $11.48 \text{ cm}^3\text{mol}^{-1}\text{K}$ ) for one isolated  $\text{Er}^{\text{III}}$  ion, ( $^4\text{I}_{15/2}$ ,  $S = 3/2$ ,  $L = 6$ ,  $g = 6/5$ ). The  $\chi T$  product for **2** and **8** steadily decreases with decreasing temperature to reach minimum values of  $5.86 \text{ cm}^3\text{mol}^{-1}\text{K}$  and  $6.04 \text{ cm}^3\text{mol}^{-1}\text{K}$ , respectively, at 2 K. The decrease observed for these complexes is due to the effects of the thermal depopulation of the  $m_J$  sublevels of the ground multiplet of the  $\text{Dy}^{\text{III}}$  and  $\text{Er}^{\text{III}}$  ions, which are originated by the crystal field.

Figure S6.- Field dependence of the Magnetization for compounds **2**, **3**, **5** and **8**

The magnetization value per  $\text{Dy}^{\text{III}}$  ion at 5 T for compounds **2** and **8** and per  $\text{Er}^{\text{III}}$  ion for **3** and **5** is considerably smaller than the expected saturation value for one free  $\text{Dy}^{\text{III}}$  ion of  $10 N\mu_{\text{B}}$  ( $M_{\text{S}}/N\mu_{\text{B}} = g_J J = 10 N\mu_{\text{B}}$ ) and one free  $\text{Er}^{\text{III}}$  ion of ( $M_{\text{S}}/N\mu_{\text{B}} = g_J J = 9 N\mu_{\text{B}}$ ) and is similar to those estimated and observed for other  $\text{Dy}^{\text{III}}$  and  $\text{Er}^{\text{III}}$  mononuclear complexes with approximate axial symmetry. This behavior is likely due to crystal-field effects leading to

significant magnetic anisotropy, which eliminates the 16-fold degeneracy of the  ${}^6H_{15/2}$  and  ${}^4I_{15/2}$  ground states, for  $\text{Dy}^{\text{III}}$  and  $\text{Er}^{\text{III}}$ , respectively
