2. UV-Vis absorption and emission spectra of **3** and **4**

2.1. UV-Vis absorption spectra of **3** (monoBr) and **4** (monoPF₆) recorded using MeCN under ambient conditions.

2.2. Emission spectra of **3** (monoBr) and **4** (monoPF₆) recorded using degassed MeCN

Supplementary Table S1. Photophysical properties of **3** and **4**

Compound	λ_{max} (nm) ($\log(\epsilon)$) ^a	Φ_f^b
3	245 (4.50), 275 (4.47)	0.31
4	245 (4.59), 275 (4.55)	0.28

^aMesurements were performed in MeCN under ambient conditions. Molar extinction coefficients (ϵ , in $\text{M}^{-1}\text{cm}^{-1}$) were determined from Beer's law plots. ^bEmission quantum yield was measured in degassed MeCN, with recrystallized anthracene in degassed EtOH as standard ($\Phi_f = 0.27$), exciting at 317 nm.

3. X-Ray Crystallography

Crystals suitable for X-ray study were obtained by slow diffusion of hexane into a concentrated solution of the complex in chloroform (**3**, **5a**, **6b**) or dichloromethane (**9b**). Diffraction data was collected on a Agilent SuperNova diffractometer equipped with an Atlas CCD detector using Mo-K α radiation ($\lambda = 0.71073 \text{ \AA}$). Single crystals were mounted on a MicroMount® polymer tip (MiteGen) in a random orientation. Absorption corrections based on the multiscan method were applied.¹ The structure was solved by direct methods in SHELXS-97 and refined by the full-matrix method based on F^2 with the program SHELXL-97² using the OLEX software package.³

Key details of the crystal and structure refinement data are summarized in Supplementary Table S1.
