Laboratory X-ray powder diffraction (LXRPD). Patterns were recorded in Bragg-Brentano reflection geometry ($\theta/2\theta$) on an X'Pert PRO MPD diffractometer (PANalytical B.V.) using strictly monochromatic $\text{CuK}\alpha_1$ radiation ($\lambda=1.54059\text{\AA}$) [Ge (111) primary monochromator]. The X-ray tube worked at 45 kV and 40 mA. The optics configuration was a fixed divergence slit ($1/2^\circ$), a fixed incident antiscatter slit (1°), a fixed diffracted anti-scatter slit ($1/2^\circ$) and X'Celerator RTMS (Real Time Multiple Strip) detector, working in scanning mode with maximum active length. Data were collected from 5° to 70° (2θ) for ~2 hours. The samples were rotated during data collection at 16 rpm in order to enhance particle statistics.

The external standard pattern was collected in identical diffractometer configuration/conditions (except for the spinning rate of the sample) and as close in time as possible to the pastes measurements to determine a diffractometer constant (G-factor). A polished polycrystalline quartz rock was used as secondary standard placed on the diffractometer in the very same orientation each measurement^{1,2}. The suitability of this quartz-rock was tested against NIST standard reference material SRM-676a (α - Al_2O_3)³.

Table S1. Elemental composition of two clinkers and gypsum (determined by XRF)

	BCSAF_B0	BCSAF_B2	Gypsum
CaO	51.70	50.54	39.95
Al_2O_3	18.80	16.88	0.47
Fe_2O_3	6.72	6.22	0.15
SiO_2	16.70	16.38	0.93
SO_3	3.68	3.67	54.42
B_2O_3	0.23	2.70	
Na_2O	<0.08	1.55	0.26
K_2O	0.34	0.33	0.07
MgO	0.99	0.96	0.13
P_2O_5	0.055	0.059	0.56
TiO_2	0.65	0.61	
SrO	0.028	0.03	3.05
Cr_2O_3	0.028	0.023	
MnO	0.036	0.034
