

Table S1. Mass spectrometry analyses of purified cytochrome *bc*₁: Comprehensive list of detected peptides relevant to F144, H217, wild type, mutations and related epitope tags. Digestions, nano-LC-MS/MS conditions and data analysis procedures are described in Materials and Methods. Sequest analysis results were filtered using standard values for X_{corr} (1.5, 2.0, 2.5 for *m/z* of +1,+2 and +3, respectively) and ΔC_N(> 0.1). Methionine modifications are: oxidation (*, +16), homoserine formation (@, -30) and homoserine lactone formation (#, -48).

Figure S1. Light-induced, time-resolved cytochrome *b* reduction and cytochrome *c* re-reduction kinetics of an *R. capsulatus* RecA⁻ strain producing heterodimeric (cyt *b*-S: F144R + cyt *b*-F: H217L) cytochrome *bc*₁ variant. See Materials and Methods, Figure 5 legend, and the text for description and interpretation of these data.

The traces shown here obtained using a RecA⁻ background are qualitatively similar to those shown in Figure 5 obtained using a RecA⁺ background except that the signal/noise ratio in the former case is poor, due to lower yield of chromatophores.
