## B) General Methods (Chemical synthesis):

All reactions were carried out in flame-dried glassware under Nitrogen atmosphere. Thin layer chromatography (TLC) was carried out on aluminium sheets coated with silica gel $60 \mathrm{~F}_{254}$ (Merck, 1.05554) and the spots were visualized with UV light at 254 nm or alternatively by staining with aqueous basic potassium permanganate or ceric ammonium molybdate. Flash column chromatography was performed using silica gel (Merck, 60A, 230400 Mesh). Commercially available reagents were used as supplied and some of them were distilled before use. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ nuclear magnetic resonance (NMR) spectra were recorded on Varian 400 MHz . NMR spectrometer at the frequency indicated. Where indicated, NMR peak assignments were made using COSY and NOESY experiments. All chemical shifts are quoted on the $\delta$-scale and were referenced to residual solvent as an internal standard. Combinations of the following abbreviations are used to describe NMR spectra: $\mathrm{s}=$ singlet; bs = broad singlet; $\mathrm{d}=$ doublet; $\mathrm{t}=$ triplet; $\mathrm{q}=$ quartet; $\mathrm{m}=$ multiplet. Mass spectra and LCMS were recorded using electron impact, chemical ionisation or electrospray ionisation techniques, mass spectrometer on Agilent 6430 Triple quardrupole. High-performance liquid chromatography was carried out on Agilent 1200 series. All reactions were performed in oven dried glassware. DMF, DCM and THF were dried immediately prior to use according to standard procedures. Acetone was distilled under inert atmosphere from $\mathrm{K}_{2} \mathrm{CO}_{3}$, Dimethylformamide, Dichloromethane was distilled under $\mathrm{N}_{2}$ from $\mathrm{CaH}_{2}$, and Tetrahydrofuran were distilled under $\mathrm{N}_{2}$ over Na . All solvents were removed by evaporation under reduced pressure

After completion of reaction (monitored by TLC), 50 mL brine solution was added and extracted with ethyl acetate $(3 \times 200 \mathrm{~mL})$. Combined organic layer was dried over anhydrous sodium sulfate, filtered and concentrated to leave a crude.
2. To the above crude in $60 \mathrm{ml} \mathrm{DCM},(\mathrm{Boc})_{2} \mathrm{O}(26.45 \mathrm{mmol})$ was added slowly at $0{ }^{\circ} \mathrm{C}$, stirred at rt for 1 h . After completion of reaction (monitored by TLC), 50 mL saturated $\mathrm{NaHCO}_{3}$ solution was added and extracted with ethyl acetate ( $2 \times 150 \mathrm{~mL}$ ). Combined organic layer was dried over anhydrous sodium sulfate, filtered and concentrated to leave a crude.
3. To the above crude in 100 mL dry DMF, $\mathrm{NaH}(41.66 \mathrm{mmol})$ was added portionwise at $0{ }^{\circ} \mathrm{C}$, followed by allylbromide ( 41.66 mmol ), stirred at rt for 16 h . After completion of reaction (monitored by TLC), 100 mL saturated ammonium chloride solution was added cautiously and extracted with ethyl acetate $(2 \times 100 \mathrm{~mL})$. Combined organic layer was dried over anhydrous sodium sulfate, filtered and concentrated to leave a crude, which was purified by flash chromatography giving the pure compound.
4. To the above pure compound in 10 mL dry THF, 10 mL TFA was added at $0{ }^{\circ} \mathrm{C}$, stirred at rt for 2 h . After completion of reaction (monitored by TLC), 100 mL saturated $\mathrm{NaHCO}_{3}$ solution was added cautiously and extracted with ethyl acetate $(2 \times 100 \mathrm{~mL})$. Purification of compound by acid-base neutralisation technique, then
organic layer was dried over anhydrous sodium sulfate, filtered and concentrated afforded the amino alcohol buildingblock (3.1) .

To a solution of $\mathbf{S 8}(\mathbf{a}-\mathbf{c})$ ( 1 eq ) in little amount of dry THF at $0^{\circ} \mathrm{C}$ was added DBU (2 eq), then stirred for 10 min . Dry DCM was added to the reaction mixture followed by acid chloride $\left(\mathrm{R}_{2} \mathrm{COCl}\right)$ carefully at $0^{\circ} \mathrm{C}$. The reaction mixture was allowed to stir for 10 min . Saturated
sodium bicarbonate solution was added to the reaction mixture and compound extracted thrice with ethylacetate. The organic phase was dried over anhydrous sodium sulfate, filtered and concentrated in vacuo. Purification of the residue by flash chromatography over silica gel with 4:1 hexane and ethyl acetate afforded product $4.4(\mathbf{a}-\mathbf{d})$ as a light yellow oil.

## VI. Zebrafish Screen

## Zebrafish husbandry

Animals were maintained separately under 14/10-hour light/dark cycle and embryos were obtained by natural mating and staged according to Kimmel et. al (1). Zebrafish embryos of stages older than 24 hpf were treated with $0.03 \%$ PTU (N-Phenylthiourea) when needed to inhibit pigment formation. Transgenic line Tg (fli:EGFP) was used to assess effects on angiogenesis, Islet1:GFP was used to assess trunk neurogenesis and axonal growth and AB wild type strain was used for studying epiboly effects of the compounds.

## Zebrafish embryo collection and Small molecule Screening

Zebrafish embryos for small molecule screening experiments were collected via pair wise matings, cleaned and incubated in PTU treated E3 water at 28.3 C. One to four cell stage embryos were then distributed into 96 well clear bottom plate (Corning). The compound exposure was done in 96 well plate (Corning) and three embryos were taken in each well contain $200 \mu \mathrm{l}$ of ( 0.5 to $15 \mu \mathrm{M}$ ) compound in PTU treated egg water. The 96 well plates were incubated at $28.3^{\circ} \mathrm{C}$ and the embryos were allowed to grow for 10 hpf to assess the effect on epiboly or up to 36 hpf to assess the effect on angiogenesis and trunk neurons. Phenotypes were scored using a Zeiss Axiovert 200 inverted microscope equipped with a cooled CCD camera. Photographs were processed and assembled using Photoshop software.

We exposed a total of 30 embryos per compound producing defects in angiogenesis and early embryo developmental defects. We then quantified the number of embryos exhibiting severe defects in each treatment. Embryos at 2.5 M completely exhibited the severe phenotype, this percentage dropped drastically when the concentration was slightly lowered.

Additional Materials and Methods:
The compounds producing phenotype (Angiogenesis and Early Developmental Defect) in zebrafish were taken for further analyses. A total of 10 embryos per well ( $\mathrm{n}=3 \mathrm{X} 10$ embryos (30 embryos) for each compound) in a 6 well plate were exposed to either $1.5,2.0$ or 2.5 M of the hit compound and the number of embryos producing the effect were visually quantified and represented in percentage. Compounds at 1.5 M concentration did not produce any effect ( $100 \%$ no effect), however at 2.0 M some of the embryos did exhibit severe effect of the compound.

Phenotypic evaluation and classification was done manually looking at the embryos after compound exposure. Three embryos were taken per concentration of each compound.
