General. All starting materials and reagents were purchased from commercial sources and used as received unless otherwise noted. $(R)$ - and $(S)$-tert-butanesulfinamide ( $>99 \%$ ee) and ( $R$ )-2,4,6-triisopropylphenylsulfinamide ( $>99 \%$ ee) were purchased from AstaTech, Inc. Melting points are uncorrected. Optical rotations were measured on a Perkin-Elmer polarimeter. NMR spectra were recorded on Bruker 400 or 500 MHz instruments. All ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data were referenced to the internal deuterated solvent relative to TMS at 0 ppm . High resolution mass spectroscopy (HRMS) was performed on a TOF instrument with ESI in positive ionization mode. Flash chromatography was performed on a Combi-Flash automated system with silica columns. HPLC analysis for reaction monitoring and diastereoselectivity determination was performed on an Agilent

1100 LC system with one of the following three methods (the method used is listed in the experimental part for each addition product): Method A: TSK-gel SuperODS column (ID 4.6 mm , length 5.0 cm ), detection at 220 nm , run time 5 min , mobile phase $A=$ water with $0.2 \%$ TFA, mobile phase $\mathrm{B}=\mathrm{MeCN}$ with $0.2 \% \mathrm{TFA}$, ramp from $10 \%$ B to $90 \%$ B in 3.5 min , hold at $90 \%$ B until 5 min , column temperature $25^{\circ} \mathrm{C}$; Method B: SB Phenyl column (ID 4.6 mm , length 10.0 cm ), detection at 220 nm , run time 30 min , mobile phase $\mathrm{A}=$ water with $0.2 \% \mathrm{H}_{3} \mathrm{PO}_{4}$, mobile phase $\mathrm{B}=\mathrm{MeOH}$, ramp from 65 to $75 \% \mathrm{~B}$ in 14 min , ramp from $75 \%$ B to $85 \%$ B from 14 to 25 min , ramp from $85 \%$ B to $90 \%$ B from 25 to 30 min, column temperature $25^{\circ} \mathrm{C}$; Method C: Chiralpak AD-3 column (ID 4.6 mm , length 15.0 cm ), detection at 220 nm , run time 6.0 min , isocratic $65 / 35$ heptane/isopropanol, column temperature $35{ }^{\circ} \mathrm{C}$. Chiral HPLC analysis of $\mathbf{3}$ was performed using the following method: Chiralpak AD-3 column (ID 4.6 mm , length 15.0 cm ), detection at 230 nm , run time 8.5 min , isocratic 94/6 heptane/isopropanol, column temperature $25^{\circ} \mathrm{C}$.

4,4-Dimethyl-1-phenylpent-1-yn-3-one, the ketone used to prepare TBS ketimine 32, was prepared by the procedure of Kim and co-workers $\left(\mathrm{ZnBr}_{2}\right.$ mediated coupling of trimethylacetyl chloride with phenylacetylene). ${ }^{1}$

Sulfinyl aldimines were prepared by the $\mathrm{Ti}(\mathrm{OEt})_{4}$ procedure of Ellman and coworkers, with some modifications in the workup. ${ }^{2}$ Instead of adding the reaction mixtures to brine, the reaction mixtures were diluted with EtOAc and treated with a small amount of water to effect controlled formation of $\mathrm{TiO}_{2}$. This procedure allowed the subsequent filtration of $\mathrm{TiO}_{2}$ to proceed more quickly. Sulfinyl ketimines were prepared by a modified procedure, using neat $\mathrm{Ti}(\mathrm{OEt})_{4}$ (no co-solvent). This resulted in much faster reactions than when a co-solvent was used.

Stereochemistry Assignments. The stereochemistry of aldimine addition product $\mathbf{2 b}$ was assigned from X-ray crystal structure determination. The stereochemistry of aldimine addition product 2a was determined by comparision of the chiral HPLC of $\mathbf{3}$ obtained by deprotection of its tert-butanesulfinyl group with $\mathbf{3}$ obtained by deprotection of the 2,4,6-triisopropylphenylsulfinyl group of $\mathbf{2 b}$. Both 2a and 2b gave the same ( $S$ )enantiomer of $\mathbf{3}$ after sulfinyl deprotection. All the other aldimine addition products in Table 1 were inferred to have the same relative stereochemistry based on the assignments of $\mathbf{2 a}$ and $\mathbf{2 b}$. The stereochemistry of ketimine addition product $\mathbf{2 1}$ was assigned from Xray crystal structure determination. All the other ketimine addition products in Table 2 were inferred to have the same relative stereochemistry based on the assignment of $\mathbf{2 1}$. The stereochemistry of dipeptide $\mathbf{4 2}$ was assigned by X-ray crystal structure determination.

Diastereoselectivity Determination. The reaction diastereoselectivity was determined from the crude reaction mixture by HPLC analysis. Authentic mixtures of diastereomers were prepared from the purified product by the procedure of Ellman and co-workers. ${ }^{3}$ In the case of ketimine derived substrates 21, 23, 25, 27, 29, 31, and 33, this procedure was not effective for generating the diastereomeric mixture (sulfinyl deprotection occurred, but re-sulfinylation did not occur on addition of $\mathrm{Et}_{3} \mathrm{~N}$, likely due to the sterically hindered nature of these amines). For these substrates, after sulfinyl

[^0]deprotection was complete, excess commercially available racemic tert-butanesulfinyl chloride (10-20 equiv) was added followed by $\mathrm{Et}_{3} \mathrm{~N}$ (20-40 equiv). For TIPPS ketimine addition product 35 , authentic diastereomer preparation was not possible, and the reaction diastereoselectivity was estimated as $>97: 3$ by ${ }^{1} \mathrm{H}$ NMR analysis of the crude reaction mixture (the minor diastereomer was not detected). Likewise, in the formation of dipeptide 42, the diastereoselectivity of the addition reaction was estimated as $>97: 3$ by ${ }^{1} \mathrm{H}$ NMR analysis of the crude reaction mixture (the minor diastereomer was not detected).

## Procedures and data for $\boldsymbol{N}$-sulfinylimines.

(R)- $\boldsymbol{N}$-(2,2-Dimethylpropylidene)-2-methylpropane-2-sulfinamide (1a). To a flask containing (R)-tert-butanesulfinamide ( $5.00 \mathrm{~g}, 41.3 \mathrm{mmol}, 1.0$ equiv) and THF ( 17 mL ) was added trimethylacetaldehyde ( $5.38 \mathrm{~mL}, 49.5 \mathrm{mmol}, 1.2$ equiv) followed by $\mathrm{Ti}(\mathrm{OEt})_{4}$ ( $17.3 \mathrm{~mL}, 82.5 \mathrm{mmol}, 2.0$ equiv). The reaction mixture was stirred at rt for 5 h , and then diluted with MTBE ( 150 mL ). Water $(5.0 \mathrm{~mL})$ was added dropwise with vigorous stirring. The resultant slurry was stirred at rt for 15 min and filtered through a 1 cm pad of Celite. The Celite cake was washed with MTBE ( 50 mL ), and the filtrate was washed with water ( $3 \times 100 \mathrm{~mL}$ ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated to an oil. The oil was further dried under vacuum to give the product ( $5.70 \mathrm{~g}, 73 \%$ yield) as an oil which crystallized on standing to a white solid. mp $37-39{ }^{\circ} \mathrm{C}$; $[\alpha]_{\mathrm{D}}{ }^{20}-267.0\left(c 3.23, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.93$ (s, 1 H ), 1.19 (s, 9 H ), 1.16 ( s, 9 H ); ${ }^{13} \mathrm{C}$ NMR (100 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 175.6,56.5,37.9,26.7,22.3$; HRMS: calcd for $\mathrm{C}_{9} \mathrm{H}_{20} \mathrm{NOS}[\mathrm{M}+\mathrm{H}]$ : 190.1260. To a flask containing (R)-2,4,6-triisopropylbenzenesulfinamide ( $10.00 \mathrm{~g}, 37.4 \mathrm{mmol}, 1.0$ equiv) and THF ( 31 mL ) was added trimethylacetaldehyde ( $10.0 \mathrm{~mL}, 92.1 \mathrm{mmol}, 2.5$ equiv) followed by $\mathrm{Ti}(\mathrm{OEt})_{4}(31.0 \mathrm{~mL}, 149.6 \mathrm{mmol}, 4.0$ equiv $)$. The reaction mixture was stirred at rt for 16 h , and then diluted with EtOAc ( 300 mL ). Water $(10.0 \mathrm{~mL})$ was added
dropwise with vigorous stirring. The resultant slurry was stirred at rt for 15 min and filtered through a 1 cm pad of Celite. The Celite cake was washed with EtOAc ( 50 mL ), and the filtrate was washed with water ( $2 \times 100 \mathrm{~mL}$ ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated to an oil. The oil was chased with MeOH , and subsequent crystallization from MeOH at $0^{\circ} \mathrm{C}$ gave the pure product $(10.65 \mathrm{~g}, 85 \%$ yield) as an off-white solid. mp $89-90{ }^{\circ} \mathrm{C}$; $[\alpha]_{\mathrm{D}}{ }^{20}-208.0\left(c 3.64, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.17(\mathrm{~s}, 1 \mathrm{H})$, $7.07(\mathrm{~s}, 2 \mathrm{H}), 3.78-3.68(\mathrm{~m}, 2 \mathrm{H}), 2.93-2.83(\mathrm{~m}, 1 \mathrm{H}), 1.27-1.21(\mathrm{~m}, 18 \mathrm{H}), 1.16(\mathrm{~s}, 9 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 174.0,152.5,149.6,134.7,122.9,37.9,34.4,27.8,26.4$, 24.5, 24.1, 23.8, 23.7; HRMS: calcd for $\mathrm{C}_{20} \mathrm{H}_{34} \mathrm{NOS}[\mathrm{M}+\mathrm{H}]$ : 336.2356. ## Procedures and data for $\alpha$-aminoamides.

General Procedure for Carbamoyl Anion Addition to $\boldsymbol{N}$-Sulfinylimines. A solution of $N$-sulfinylimine ( 1.00 equiv), formamide ( 3.1 equiv) and toluene ( 10 volumes based on $N$-sulfinylimine) was cooled to $-78^{\circ} \mathrm{C}$. LDA ( 3.0 equiv of commercially available 2.0 M solution) was added dropwise. The reaction mixture was stirred at $-78^{\circ} \mathrm{C}$ for 10 min , and then quenched by the addition of water. After warming to rt, the reaction mixture was diluted with EtOAc and the layers were separated. The organic phase was washed with water (2-3 times), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated. The crude product was purified by either flash column chromatography or crystallization as indicated.

After stirring for 5 min at $-100{ }^{\circ} \mathrm{C}$, approximately 1.0 mL of the anion solution was transferred via cannula to an inerted NMR tube immersed in an EtOH/liquid nitrogen dewar (temperature $-90^{\circ} \mathrm{C}$ ). The NMR tube was transferred quickly to a 500 MHz NMR spectrometer, the probe of which had previously been cooled to $-68^{\circ} \mathrm{C}$. After shimming, the ${ }^{13} \mathrm{C}$ NMR spectrum was recorded using a broad sweep width. The spectrum was referenced to the $\alpha-\mathrm{C}$ of $d-8 \mathrm{THF}$ at 67.57 ppm . Due to ${ }^{6} \mathrm{Li}$ and ${ }^{7} \mathrm{Li}$ coupling with ${ }^{13} \mathrm{C}$, the signals were broad. See page S 104 for copies of the spectrum

## Computational Modeling Studies.

All calculations were conducted with the Guassian $09^{4}$ Unix version on a HPC system at the DFT B3LYP level of theory with the $6-311 \mathrm{G}+(\mathrm{d}, 2 \mathrm{p})$ basis set with the CPCM (THF) solvation model. All optimized conformers were subjected to a frequency check to verify the optimized structure is a stable structure (zero imaginary frequencies). To complete the tetrahedral structure of the Li species, the lithium atom was saturated with THF molecules. All structures were subjected to a Conformation search employing the Moe2011.10 program with the LowModeMd method. The lowest energy conformer was then subjected to the DFT optimization with the Gaussian 09 program. ${ }^{4}$ The optimized structures were then subjected to a NMR calculation (B3LYP/6-311G+(d,2p)) with the CPCM (THF) solvation model employing the IGAIM method within Gaussian 09. The final carbon shift was determined by referencing to a separately calculated reference carbon NMR with the optimized TMS structure (B3LYP/6-311G+(d,2p)) with the CPCM (THF) solvation model employing the IGAIM method within Gaussian 09.
