It has been observed that the reaction between chloro bridged ruthenium complexes $\left[\left\{\left(\eta^{6}-\right.\right.\right.$ arene $\left.) \mathrm{Ru}(\mu-\mathrm{Cl}) \mathrm{Cl}_{2}\right]\left(\eta^{6}\right.$-arene $\left.=\mathrm{C}_{6} \mathrm{H}_{6}, \mathrm{C}_{10} \mathrm{H}_{14}\right)$ and structurally analogous rhodium/iridium dimers $\left[\left\{\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Me}_{5}\right) \mathrm{M}(\mu-\mathrm{Cl}) \mathrm{Cl}\right\}_{2}\right] \quad[\mathrm{M}=\mathrm{Rh}$, Ir] with 4-(pyridin-2-ylmethoxy)-phenyldipyrromethane with DDQ in $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{CH}_{3} \mathrm{OH}(1: 1, \mathrm{v} / \mathrm{v})$ in presence of triethylamine at rt gave neutral heteroleptic dipyrrinato complexes $\left[\left(\eta^{6}\right.\right.$-arene $) \mathrm{RuCl}(2$-pcdpm $\left.)\right]$ and $\left[\left(\eta^{5}-\mathrm{C}_{5} \mathrm{Me}_{5}\right) \mathrm{MCl}-(2-\right.$ pcdpm $)]\left(\eta^{6}\right.$-arene $\left.=\mathrm{C}_{6} \mathrm{H}_{6}, \mathbf{1} ; \mathrm{C}_{10} \mathrm{H}_{14}, \mathbf{2} ; \mathrm{M}=\mathrm{Rh}, \mathbf{3} ; \mathrm{Ir}, \mathbf{4}\right)$. Conversely, 4-(pyridin-3-ylmethoxy)phenyldipyrromethane and 4-(pyridin-4-ylmethoxy)-phenyldipyrromethane undergo etheratic (C-O-C) bond cleavage with representative precursor $\left[\left\{\left(\eta^{6}-\mathrm{C}_{10} \mathrm{H}_{14}\right) \mathrm{Ru}(\mu-\mathrm{Cl}) \mathrm{Cl}\right\}_{2}\right]$ leads to formation of the same complex $\left[\left(\eta^{6}-\mathrm{C}_{10} \mathrm{H}_{14}\right) \mathrm{RuCl}(4-\mathrm{OH}-\mathrm{pdpm})\right]$, 5. It is well known that such a ethers i.e. benzyl ethers and naphthylmethyl ethers have been acting as protecting groups in organic synthesis owing to their facile oxidative cleavage with either dichlorodicyanoquinone (DDQ) or ceric ammonium nitrate (CAN). ${ }^{1}$ Based on the evidences one may propose a reaction mechanism for cleavage of ether bond (Scheme S2). Initially, one of the benzylic hydrogen was abstracted by DDQ to form the benzylic cation. Further, nucleophilic methoxide ion $\left(\mathrm{MeO}^{-}\right)$ attacks to the electrophilic carbon centre results in the formation of unstable intermediate which undergoes hydrolytic cleavage to form phenol and ketone. In contrary, the insitu oxidised species 2-pcdpm did not undergo etheratic bond cleavage which may be associated to the steric hindrance of the lone pairs of N (pyridyl) and oxygen (C-O-C, etheratic).
