## General Experimental

Unless specified otherwise, all reactions were carried out under a dry nitrogen atmosphere using standard glovebox, Schlenk, or vacuum-line techniques. Octane,  $\geq 98\%$ , was used as received from Alfa Aesar. All other reagents were used as received. Solvents were purified before use: benzene and pentane were purified by passage through columns of activated alumina and molecular sieves. Deuterated solvents were purchased from Cambridge Isotope Laboratories. Benzene-*d*<sub>6</sub>, toluene-*d*<sub>8</sub> were dried over sodium/benzophenone and dichloromethane-*d*<sub>2</sub>, chloroform-*d*<sub>1</sub> were dried over CaH<sub>2</sub>. NMR spectra were obtained on Bruker AV300 or AV500 MHZ spectrometers with chemical shifts ( $\delta$ ) reported in ppm downfield of tetramethylsilane. Octane dehydrogenation reactions were quantified using Agilent 7890A gas chromatograph with a 30 m x 0.32 mm Agilent GASPRO capillary column. <sup>dm</sup>Phebox, <sup>iPr</sup>Phebox, and <sup>r</sup>PheboxIr(OAc)<sub>2</sub>(OH<sub>2</sub>) (**1a** (R = CH<sub>3</sub>), **1b** (R = <sup>i</sup>Pr, H) were prepared according to published procedures.<sup>1</sup> Elemental analyses were performed by Atlantic Microlab Inc. of Norcross, GA.

## GC Method

GC analyses (FID detection) were performed on an Agilent 7890A GC instrument fitted with an Agilent GS-GASPRO column (30 m length x 0.32 mm ID) using the following GC method:

Detector: FID

Starting temperature: 100 °C

Time at starting temp: 0 min

Ramp1: 10 °C/min up to 260 °C; hold for 5 min

Flow rate (carrier): 2 mL/min (He)

Split ratio: 25:1

Inlet temperature: 250 °C

Detector temperature: 250 °C
