## Supporting Information for:

# Cis-Trans Isomerizations of Proline Residues are Key to Bradykinin Conformations 

Nicholas A. Pierson, ${ }^{\dagger}$ Liuxi Chen, ${ }^{\dagger}$ David H. Russell, ${ }^{\dagger}$ and David E. Clemmer*, ${ }^{\dagger}$<br>${ }^{\dagger}$ Department of Chemistry, Indiana University, Bloomington, IN 47405<br>${ }^{\ddagger}$ Department of Chemistry, Texas A\&M University, College Station, TX 77843

Supporting Information section includes Figures S1 through S4 as discussed in the main text.

Figure S1. Schematic diagram of the home-built ion mobility - mass spectrometer at Indiana University, described in detail in the Experimental section.

Figure S2. Mass spectrum of acetylated BK. The inset is a 250 x blow up of $\mathrm{m} / \mathrm{z}$ region $366-374$, which shows there is no presence of the $[\text { acetyl }-\mathrm{BK}+3 \mathrm{H}]^{3+}$ ion at $m / z 368.2$.

Figure S3. IM-IM-MS studies of $\mathrm{Pro}^{3} \rightarrow$ Ala BK (RPAGFSPFR) (red traces), where the IM-MS cross section distribution of $[\mathrm{M}+3 \mathrm{H}]^{3+}$ ions is shown across the bottom, three different IM-IM-MS selections in the middle (vertical dashed line represents where the selection pulse was applied), and IM-IM-MS distributions obtained from collisional activation of the three selections on top. The $[\mathrm{BK}+3 \mathrm{H}]^{3+}$ cross section distribution (dashed traces) is shown in all panels for comparison with the analogue peptide. The IM-IM-MS selection and activation results indicate the middle peak in the $\mathrm{IM}-\mathrm{MS}$ distribution of $\mathrm{Pro}^{3} \rightarrow \mathrm{Ala} \mathrm{BK}[\mathrm{M}+3 \mathrm{H}]^{3+}$ is not a stable conformation. Cross section values for the analogue peptide were shifted to compare with BK according to amino acid size parameters in ref. 33.

Figure S4. IM-IM-MS (a) selection of $\left[\mathrm{Pro}^{7} \rightarrow \mathrm{Ala} \mathrm{BK}+3 \mathrm{H}\right]^{3+}$ and (b) activation by application of $60 \mathrm{~V}\left(200 \mathrm{~V} \cdot \mathrm{~cm}^{-1}\right)$ in IA2 region. The vertical dashed line represents where across the distribution the selection pulse was applied. Upon activation, the distribution shifts to a higher mobility. Cross section values for the analogue peptide were shifted to compare with BK according to amino acid size parameters in ref. 33 .
