## Supporting Information

General: ${ }^{1} \mathrm{H},{ }^{31} \mathrm{P},{ }^{13} \mathrm{C}$ NMR spectra were recorded on Varian 600 MHz NMR spectrometer. Chemical shifts were determined relative to internal $\left(\mathrm{CH}_{3}\right)_{4} \mathrm{Si}$ (TMS). All yields reported refer to isolated yields unless otherwise indicated. Mn and $\mathrm{Mw} / \mathrm{Mn}$ (PDI) value of polymers were measured with gel permeation chromatography (Waters alliance GPC 2000) using THF as eluent ( $1 \mathrm{~mL} / \mathrm{min}$ ) at $40^{\circ} \mathrm{C}$, which were calibrated with polystyrene standards. Melting points were measured on a Fisher-Johns Melting Point Apparatus and uncorrected.

1,4-Dibromo-2,5-bis(hexyloxy)benzene, 2,5-bis(hexyloxy)-1,4-phenylenediboronic acid were prepared according to the reported procedure. ${ }^{1}$ 7-Dibromo-9,9-dioctyl-9H-fluorene, 2,7-dibromo-9,9-dihexyl-9H-fluorene, 9,9-dioctyl-2,7-bis(4,4',5,5'-tetramethyl-1,3,2-dioxaborolan-2-yl)-9H-fluorene and 9,9-dihexyl-2,7-bis(4,4',5,5'-tetramethyl-1,3,2-dioxaborolan-2-yl)-9H-fluorene are prepared in a way similar to the literature. ${ }^{2}$ Ferrocenylmethyl alcohol was also prepared according to reported literature. ${ }^{3}$ Complexes $\mathbf{1 b}$ and $\mathbf{1 d}$ were prepared by following reported method. ${ }^{4}$ The purity of these monomers was estimated to be greater than $98 \%$ as determined by ${ }^{1} \mathrm{H}$ NMR or GC-MS. The product purity was estimated to be greater than $95 \%$ as determined by ${ }^{1} \mathrm{H}$ NMR. THF was freshly distilled from sodium/benzophenone. Unless otherwise mentioned, other solvents and reagents were purchased from commercial sources and used as received.

General Procedure for the Synthesis of precatalyst 1a and 1c: In a glovebox, a mixture of $\operatorname{Pd}(\mathrm{OAc})_{2}(336 \mathrm{mg}, 1.5 \mathrm{mmol})$ and 2-aminobiphenyl ( $264 \mathrm{mg}, 1.5 \mathrm{mmol}$ ) in anhydrous toluene ( 10 mL ) was heated at $60^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ atmosphere for 30 min . After the reaction was cooled to room temperature, the toluene was removed. The remaining solid was washed with anhydrous toluene ( $2 \times 2 \mathrm{~mL}$ ) and then suspended in anhydrous acetone ( 10 mL ). Lithium chloride ( $191 \mathrm{mg}, 4.5 \mathrm{mmol}$ ) was added to the suspension and the mixture was stirred at room temperature under $\mathrm{N}_{2}$ atmosphere for
$1 \mathrm{~h} . t-\mathrm{Bu}_{3} \mathrm{P}$ or $\mathrm{PCy}_{3}(1.4 \mathrm{mmol})$ was then added to the solution. The mixture was stirred at room temperature for 2.5 h . Removal of about $90 \%$ of the solvent under vacuum afforded yellow slurry, which was treated with methyl $t$-butyl ether ( 5 mL ) and pentane $(10 \mathrm{~mL})$. The mixture was then placed in refrigerator for 1 h . Then, the mixture was filtered, washed with water and pentane and dried under vacuum to afford complex $\mathbf{1 a}$ or $\mathbf{1 c}$.

General Procedure for the Suzuki cross-coupling polymerization: Under $\mathrm{N}_{2}$ atmosphere, to a solution of dibromide monomer $(0.101 \mathrm{mmol})$ and diboronic acid monomer $(0.1 \mathrm{mmol})$ in dry THF $(0.5 \mathrm{~mL})$, precatalyst $\mathbf{1 a}(0.002 \mathrm{mmol}, 2 \mathrm{mmol} \%)$ was added. $\mathrm{K}_{3} \mathrm{PO}_{4}$ solution ( $2 \mathrm{M}, 0.2 \mathrm{~mL}$ ) was then added to the mixture. After stirring at $60^{\circ} \mathrm{C}$ for 1 h , the mixture was poured into HCl solution $(5 \mathrm{M}, 10 \mathrm{~mL})$ with stirring. The product was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 15 \mathrm{~mL})$, the combined organic layer was washed with brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After removal of solvents under vacuum, the residue was dissolved in a small amount of THF and added slowly to methanol with stirring. The precipitation formed was collected by filtration, washed with methanol. The dissolution-precipitation process was repeated two more times to
afford the final product, which was dried under vacuum for 4 h .
