## Synthesis and characterization

Material and Methods. All reagents used for the syntheses in the present work were purchased from Sigma-Aldrich and used without additional purification. Reagent grade organic solvents were obtained from Sigma-Aldrich and dried by standard methods. Distilled water was further purified using a Milli-Q Ultrapure water purification system. $\left[\mathrm{Cp}{ }^{*} \operatorname{IrCl}(\mu-\mathrm{Cl})\right]_{2}$ was prepared according to literature procedure. ${ }^{1}$ Stock solutions of $\mathrm{Ce}^{+4}$ for kinetic measurements were prepared from $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{Ce}\left(\mathrm{NO}_{3}\right)_{6}$ $\left(\geq 98.0 \%\right.$, Sigma-Aldrich). Acid solutions were prepared from concentrated $\mathrm{HNO}_{3}$ (Trace Metal Grade, $\geq 65 \%$, Sigma-Aldrich) and distilled, deionized water. NMR spectra were recorded at room temperature on a Bruker Avance DRX 400 spectrometer and referenced to the residual solvent peak ( $\delta$ in ppm and $J$ in Hz ).
$\left[\mathbf{C p}{ }^{*} \operatorname{Ir}\left(\kappa^{2}-\mathbf{N}, \mathbf{O}\right) \mathbf{C l}\right]\left(\kappa^{2}-\mathrm{N}, \mathrm{O}=2\right.$-pyridinecarboxylic acid, ion(-1))(1a). This compound was synthesized in $70 \%$ overall yield slightly modifying the procedures reported in the literature. ${ }^{2}\left[\mathrm{Cp}^{*} \operatorname{IrCl}(\mu-\mathrm{Cl})\right]_{2}(100 \mathrm{mg}, 0.126 \mathrm{mmol})$ and 3.0 equivalents of 2 pyridinecarboxylic acid ( $46.5 \mathrm{mg}, 0.378 \mathrm{mmol}$ ) were dissolved in 30 mL of methanol at room temperature. A solution of 18 mg of KOH in MeOH was added to the mixture. The formation of a precipitate was immediately observed and the solution changed color from orange to yellow. After stirring for 1 h , the solution was concentrated under reduced pressure and left at $-20^{\circ} \mathrm{C}$ overnight. The resulting solid was filtered off, washed with diethyl ether and dried under reduced pressure. ${ }^{1} \mathrm{H}$ NMR ( 400.13 MHz , DMSO- $\mathrm{d}_{6}$ ) : $\delta=8.77(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=6.0 \mathrm{~Hz}), 8.12(\mathrm{t}, 1 \mathrm{H}, \mathrm{J}=5.0 \mathrm{~Hz}), 7.90(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=8.0$ Hz ), $7.75\left(\mathrm{t}, 1 \mathrm{H}, \mathrm{J}=7.0 \mathrm{~Hz}\right.$ ), $1.63(\mathrm{~s}, 15 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( 125.77 MHz , DMSO$\left.\mathrm{d}_{6}\right): \delta=171.7,150.5,150.3,139.6,129.1,126.2,84.9,8.3 \mathrm{ppm}$.
$\left[\mathbf{C p}{ }^{*} \operatorname{Ir}\left(\kappa^{\mathbf{2}}-\mathbf{N}, \mathbf{O}\right) \mathbf{N O}_{3}\right]\left(\kappa^{2}-\mathrm{N}, \mathrm{O}=2\right.$-pyridinecarboxylic acid, ion(-1)) (1b). 100 mg of $\mathbf{1 a}$ ( 0.206 mmol ) were dissolved in dichloromethane and 3 equivalents of $\mathrm{AgNO}_{3}$ ( 105 mg , 0.618 mmol ) were added. After stirring at room temperature for 18 h , the formed precipitate was filtered out and washed with dichloromethane. The latter was removed from the filtered solution by evaporation and the solid obtained was dried under reduced pressure. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ data were the same than those of 1a. Anal. Calcd. for $\mathrm{C}_{16} \mathrm{H}_{19} \mathrm{IrN}_{2} \mathrm{O}_{5}$ : C, 37.55; H, 3.74; N, 5.48. Found: C, $37.61 ; \mathrm{H}, 3.75 ; \mathrm{N}, 5.47$.
$\left[\mathbf{C p}{ }^{*} \operatorname{Ir}\left(\boldsymbol{\kappa}^{2}-\mathbf{N}, \mathbf{O}\right) \mathbf{C l}\right]\left(\kappa^{2}-\mathrm{N}, \mathrm{O}=2,4\right.$-pyridinedicarboxylic acid, ion(-1),)(2). $\left[\mathrm{Cp}^{*} \operatorname{IrCl}(\mu-\right.$ $\mathrm{Cl})]_{2}(150 \mathrm{mg}, 0.188 \mathrm{mmol})$ and 2.0 equivalents of 2,4-pyridinedicarboxylic acid (63 $\mathrm{mg}, 0.376 \mathrm{mmol}$ ) were dissolved in 15 mL of methanol at room temperature. A solution of 22 mg of KOH in MeOH was added to the mixture, which changed color from orange to yellow. After stirring for 1 h , the solution was concentrated under reduced pressure to 10 mL .2 mL of diethyl ether were added and the mixture was left at $-20^{\circ} \mathrm{C}$ for 3 h. Finally the solid was filtered off, washed with diethyl ether and dried under reduced pressure ( $159 \mathrm{mg}, 80 \%$ ). Anal. Calcd. for $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{ClIrNO}_{4}$ : C, 38.58; H, 3.62; N, 2.65. Found: C, 38.90; H, 3.80; N, 2.46.

${ }^{1} \mathrm{H}$ NMR ( 0.4 mL DMSO- $\mathrm{d}_{6}+0.1 \mathrm{~mL} \mathrm{D}_{2} \mathrm{O}\left(\mathrm{pH}=1\right.$ by $\left.\left.\mathrm{HNO}_{3}\right), 298 \mathrm{~K}, 400.13 \mathrm{MHz}\right): \delta$ $8.96\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{HH}}=5.6,1 \mathrm{H}, \mathrm{H} 6\right), 8.18\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{HH}}=1.7,1 \mathrm{H}, \mathrm{H} 3\right), 8.16\left(\mathrm{dd},{ }^{3} \mathrm{~J}_{\mathrm{HH}}=5.6,{ }^{4} \mathrm{~J}_{\mathrm{HH}}=\right.$ 1.7, 1H, H5), $1.61\left(\mathrm{~s}, 15 \mathrm{H}, \mathrm{Cp}{ }^{*}\right) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( 0.4 mL DMSO- $\mathrm{d}_{6}+0.1 \mathrm{~mL} \mathrm{D}_{2} \mathrm{O}(\mathrm{pH}$
$=1$ by $\left.\mathrm{HNO}_{3}\right)$ ): 172.5 (C7), 165.3 (C8), 152.8 (C6), 152.0 (C2), 141.6 (C4), 129.3 (C5), $126.0(\mathrm{C} 3), 86.6\left(\mathrm{C}-\mathrm{Cp}^{*}\right), 9.3\left(\mathrm{CH}_{3}-\mathrm{Cp}^{*}\right)$.
$\left[\mathbf{C p}{ }^{*} \operatorname{Ir}\left(\boldsymbol{\kappa}^{2}-\mathbf{N}, \mathbf{O}\right) \mathbf{C l}\right]\left(\kappa^{2}-\mathrm{N}, \mathrm{O}=2,6\right.$-pyridinedicarboxylic acid, ion(-1), (3). $\left[\mathrm{Cp}^{*} \operatorname{IrCl}(\mu-\right.$ $\mathrm{Cl})]_{2}(100 \mathrm{mg}, 0.126 \mathrm{mmol})$ and 2.4 equivalents of 2,6-pyridinedicarboxylic acid ( 50.4 $\mathrm{mg}, 0.302 \mathrm{mmol}$ ) were dissolved in 30 mL of methanol. A standard solution of sodium ethoxide was prepared by reacting an exact amount of sodium metal with ethanol. An aliquot of this solution, containing 0.378 mmol of NaOEt , was added to the reaction mixture at room temperature. In a few minutes, the formation of a precipitate was observed and the solution changed color from orange to yellow. After stirring for 2 h at RT, the solution was concentrated under reduced pressure and left at $-20^{\circ} \mathrm{C}$ overnight. Finally the solid was filtered off, washed with cold methanol and dried under reduced pressure ( $98.6 \mathrm{mg}, 74 \%$ ). Anal. Calcd. for $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{ClIrNO}_{4}$ : C, 38.58; H, 3.62; N, 2.65. Found: C, 38.75; H, 3.71; N, 2.51.

${ }^{1} \mathrm{H}$ NMR ( $400.13 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ): $\delta=11.7$ (brd, OH ), $8.31\left(\mathrm{dd}, 1 \mathrm{H},{ }^{3} \mathrm{~J}_{\mathrm{HH}}=6.9,{ }^{4} \mathrm{~J}_{\mathrm{HH}}=\right.$ 2.5, H3), 8.19 (AB-system, 2H, H5 and H4), 1.59 (s, 15H, Cp $\left.{ }^{*}\right)$ ppm. ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $125.77 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ): $171.0(\mathrm{C} 7), 165.0(\mathrm{C} 8), 152.5,151.8,141.2$ (C4), 131.4 (C5), $130.1(\mathrm{C} 3), 87.5\left(\mathrm{C}-\mathrm{Cp}^{*}\right), 9.1\left(\mathrm{CH}_{3}-\mathrm{Cp}^{*}\right) \mathrm{ppm}$.
$\left[\operatorname{Ir}\left(\kappa^{3}-\mathbf{N}, \mathbf{O}, \mathbf{O}\right)\left(\mathbf{1}-\kappa \mathbf{- 4 , 5 - \boldsymbol { \eta } ^ { 2 }}-\mathbf{C}_{\mathbf{8}} \mathbf{H}_{\mathbf{1 3}}\right)(\mathbf{M e O H})\right]\left(\kappa^{3}-\mathrm{N}, \mathrm{O}, \mathrm{O}=2,6\right.$-pyridinedicarboxylic acid, ion(-2)), (4). This compound was synthesized in $80-90 \%$ overall yield according to the procedure reported in literature. ${ }^{3}\left[\operatorname{Ir}(\mu-\mathrm{OMe})\left(1-\kappa-4,5-\eta^{2}-\mathrm{C}_{8} \mathrm{H}_{13}\right)_{2}\right]_{2}(50 \mathrm{mg}, 0.075 \mathrm{mmol})$
and 2,6-pyridinedicarboxylic acid ( $25 \mathrm{mg}, 0.203 \mathrm{mmol}$ ) were reacted in $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ mixture $(3 / 1,10 \mathrm{~mL})$ at room temperature for 14 h . The resulting yellow solution was filtered and then concentrated to dryness under reduced pressure. The crude compound was dissolved in a $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ mixture (20:1) mixture ( 3 mL ) and then eluted through an alumina column ( $7 \times 1.5 \mathrm{~cm}$ ) to give a yellow solution. Concentration of the solution to $c a .1 \mathrm{~mL}$ and slow addition of diethyl ether gave the compound as a yellow solid which was filtered, washed with diethyl ether ( $2 \times 3 \mathrm{~mL}$ ) and dried under reduced pressure. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ data were identical to those reported in the literature. ${ }^{3}$

## X-ray structure determination

A crystal of $\mathbf{3}$ was mounted on a Bruker APEXII CCD diffractometer and cooled to 180(2)K for the for the unit cell determination and data collection. The space group was unambiguously determined from the systematic absences.

The cell constants were refined by least-squares, at the end of the data collection, using reflections up to $2 \theta_{\max } \leq 62.5$ deg. The data were collected by using $\omega$ scans, in steps of 0.5 deg . For each of the 1440 collected frames, counting time was 20 sec .

The collected intensities were corrected for Lorentz and polarization factors ${ }^{4}$ and empirically for absorption using the SADABS program. ${ }^{5}$

Crystal data collection and refinement parameters are listed in Table S1 and in the cif file.

The structure was solved by direct and Fourier methods and refined by full matrix least squares, ${ }^{6}$ minimizing the function $\left[\mathrm{Lw}\left(\mathrm{F}_{\mathrm{o}}{ }^{2}-(1 / \mathrm{k}) \mathrm{F}_{\mathrm{c}}{ }^{2}\right) 2\right]$ using anisotropic displacement parameters for all atoms, except the hydrogens.

The H atom of the carboxylic group, involved in the strong intermolecular hydrogenbond, was located from a difference-Fourier map and the coordinates refined freely with $\mathrm{B}_{\mathrm{iso}}(\mathrm{H})=1.5 \mathrm{x} \mathrm{B}(\mathrm{O} 2)$; the contribution of the remaining hydrogen atoms, in their calculated positions, was included in the refinement using a riding model $(\mathrm{B}(\mathrm{H})=$ $\left.1.5 \mathrm{xB}\left(\mathrm{C}_{\text {bonded }}\right)\left(\AA^{2}\right)\right)$.

At the end of the refinement a difference Fourier map showed no significant feature. Refining the Flack's parameter tested the handedness of the structure. ${ }^{7}$

All calculations and plotting were carried out by using the PC version of SHELX-97, ${ }^{6}$ WINGX, ${ }^{8}$ ORTEP $^{8}$ and Mercury programs. ${ }^{9}$

An ORTEP view of the molecule with the full numbering scheme is given if Figure S1, while the Hydrogen-bond network is shown in Figure S2 and a space filling model is shown in Figure S3.

Extended lists of bond lengths ( $\AA$ ), bond angles (deg) and torsion angles (deg) are given in Tables S2 and S3 while atomic coordinates and displacement parameters are listed in the cif file.

## Electrochemical measurements

All electrochemical experiments were performed with a Bio-logic SP-150 potentiostat, using a three-electrode cell. A glassy carbon disk ( 3 mm diameter) from CH Instruments was used as working electrode, a platinum disk ( 2 mm diameter) from CH Instruments was used as the auxiliary electrode, and a SSCE from BAS was used as the reference electrode. The experiments were carried out in acetonitrile $(0.1 \quad \mathrm{M}$ tetrabutylammonium hexafluorophosphate) and in aqueous solutions at different values of $\mathrm{pH} . \mathrm{pH} 1$ catalyst solutions were obtained in $0.1 \mathrm{M} \mathrm{HNO}_{3} . \mathrm{pH} 2,7$ and 11.3 solutions were prepared from different phosphate buffers in which the necessary amount of phosphate salts was used to yield 0.1 M ionic strength solutions.

## Chemical water oxidation

Kinetic studies were conducted by: i) measuring the depletion of $\mathrm{Ce}^{+4}$ through a UV-Vis spectrophotometer, ii) directly detecting the evolved oxygen through the Clark electrode and iii) measuring the volume of the evolved oxygen.
i) UV-Vis experiments. Measurements of $\mathrm{Ce}^{+4}$ consumption were performed with a diodearray spectrometer (HP 8453). Two kind of experiments were carried out, the first one for the determination of long term TOF ( $\mathrm{TOF}_{\mathrm{LT}}$ ) and the second one for the evaluation of TON. For the determination of $\mathrm{TOF}_{\mathrm{LT}}, 200-2000$ equivalents of CAN were added to the catalyst solution. In a typical catalytic run 1.5 mL of catalyst solution in $0.1 \mathrm{M} \mathrm{HNO}_{3}(1.0-10.0 \mu \mathrm{M})$ was thermostated at $25^{\circ} \mathrm{C}$ into the cuvette for 20 min . After background correction, a solution of CAN in $0.1 \mathrm{M} \mathrm{HNO}_{3}(1.5 \mathrm{~mL}, 2.0 \mathrm{mM})$ was added to the catalyst solution and the consumption of $\mathrm{Ce}^{+4}$ was monitored at 340 nm every 5 s . For the evaluation of TON a larger amount of CAN (4000-8000 eq.) was used. In a typical catalytic run 3.0 mL of $0.1 \mathrm{M} \mathrm{HNO}_{3}$ solution was used for the background correction, then the acid solution was removed from the cuvette and 3 mL of a solution of CAN in $0.1 \mathrm{M} \mathrm{HNO}_{3}(10.1 \mathrm{mM})$ was thermostated at $25^{\circ} \mathrm{C}$ for 20 min . Finally $30-40 \mu \mathrm{~L}$ of a catalyst solution ( $95-252 \mu \mathrm{M}$ ) were added into the cuvette. and the consumption of $\mathrm{Ce}^{+4}$ was monitored at 410 nm every 5 s .
ii) Evolved oxygen by Clark electrode. Measurements of initial oxygen evolution rate ( $\mathrm{TOF}_{\text {IN }}$ ) were performed with a Clark-type oxygen electrode (Hanna, model HI 4421). Before beginning each set of experiments, the gas-permeable membrane was replaced to ensure a high-quality response. The electrode, secured in a Teflon tube, was inserted into a tight-fitting water- jacketed glass vessel. The system was kept at a constant temperature of $25^{\circ} \mathrm{C}$. In a typical experiment a CAN solution in $0.1 \mathrm{M} \mathrm{HNO}_{3}(25 \mathrm{~mL}, 2-77.4 \mathrm{mM})$ was allowed to equilibrate with stirring for 20 min . When a steady baseline was achieved, $0.6-0.8 \mathrm{~mL}$ of catalyst solution was added using a syringe through a septum. The catalyst concentration in
the total volume of reaction was $0.1-10.0 \mu \mathrm{M}$. Oxygen evolution commenced after an induction period and typically exceeded the maximum value for the system within 15 min of injection.
iii) Evolved oxygen by volumetry. Measurements of the turnover number (TON) of oxygen evolution were also performed with a custom-built apparatus. It consists of tight-fitting waterjacketed glass vessel equipped with a septum for the injection of the catalyst solution and with a side arm connected to a graduated Mohr bottle. The evolved $\mathrm{O}_{2}$ was collected in the graduated Mohr bottle and all changes in volume were recorded by reading the numbers on it. Temperature and pressure were exactly measured in each experiment and they were used for the calculation of the amount of evolved oxygen. The flask was charged with a solution of CAN in $0.1 \mathrm{M} \mathrm{HNO}_{3}(25 \mathrm{~mL}, 20.5-41.3 \mathrm{mM})$. The system was allowed to equilibrate at $25^{\circ} \mathrm{C}$ with stirring for 20 min . Finally a volume between $0.6-0.8 \mathrm{~mL}$ of the catalyst solution (161$213 \mu \mathrm{M}$ ) in $0.1 \mathrm{M} \mathrm{HNO}_{3}$ was injected through the rubber septum. The CAN and the catalyst concentration in the total volume of reaction were, respectively, $20-40 \mathrm{mM}$ and $5.0 \mu \mathrm{M}$.

${ }^{\mathrm{a}}\left[\mathrm{Ce}^{+4}\right]_{0}=1.0 \mathrm{mM} .{ }^{\mathrm{b}}\left[\mathrm{Ce}^{+4}\right]_{0}=10.0 \mathrm{mM} .{ }^{\mathrm{c}}$ From $\left(\mathrm{At}_{\mathrm{t}} / \mathrm{A}_{0}\right)_{340 \mathrm{~nm}}$ versus $-4 \mathrm{t} /\left[\mathrm{Ce}^{+4}\right]_{0}$ trends. ${ }^{\mathrm{d}}$ From the $\mathrm{k}_{\mathrm{obs}} / \mathrm{C}_{\mathrm{cat}}$ ratio.

In the experiments carried out with $\left[\mathrm{Ce}^{+4}\right]_{0}=1.0 \mathrm{mM}$, from $\mathrm{k}_{\text {obs }}$ versus $\mathrm{C}_{\text {cat }}$ trend, a mean value of $\mathrm{TOF}_{\mathrm{LT}}=0.123 \mathrm{~s}^{-1}\left(7.4 \mathrm{~min}^{-1}\right)$ was obtained. $\mathrm{A} \log \left(\mathrm{k}_{\mathrm{obs}}\right)-\log \left(\mathrm{C}_{\mathrm{cat}}\right)$ plot gave the order of reaction in catalyst. The slope of this straight line is $1.11 \pm 0.03$. A TON value of 500 was estimated by the experiment carried out with $\left[\mathrm{Ce}^{+4}\right]_{0}=10.0 \mathrm{mM}$.

Table 14S. Clark electrode results for $\left[\operatorname{Ir}\left(\kappa^{3}-\mathrm{N}, \mathrm{O}, \mathrm{O}\right)\left(1-\kappa-4,5-\eta^{2}-\mathrm{C}_{8} \mathrm{H}_{13}\right)(\mathrm{MeOH})\right]$ (4)

| $\mathrm{C}_{\text {cat }}(\mu \mathrm{M})$ | $\mathrm{TOF}_{\text {IN }}\left(\mathrm{min}^{-1}\right)^{\mathrm{a}}$ |
| :---: | :---: |
| 1.00 | $5.2 \pm 0.1$ |
| 1.00 | $6.8 \pm 0.09$ |
| 2.50 | $3.42 \pm 0.05$ |
| 2.50 | $4.02 \pm 0.03$ |
| 5.00 | $5.1 \pm 0.1$ |
| 5.00 | $7.60 \pm 0.09$ |
| 5.00 | $5.90 \pm 0.07$ |

${ }^{\mathrm{a}}$ From the $\left[\mathrm{O}_{2}\right]$ versus t , divided by $\mathrm{C}_{\mathrm{cat}}\left(\left[\mathrm{Ce}^{+4}\right]_{0}=20.0 \mathrm{mM}\right)$.

The average value for $\mathrm{TOF}_{\text {IN }}$ is $5 \pm 1 \mathrm{~min}^{-1}$ ( $\pm$ standard deviation).
