### 1. GPAW computational details

We used the density-functional theory (DFT) as implemented in the real-space code package GPAW.<sup>1,2</sup> The PAW setups for Au include scalar-relativistic effects. The 2-PET ligands were reduced to –SH groups in the initial sampling of a representative set (about 20) of potential structures. Structural relaxations were done using 0.2 Å grid spacing and convergence criterion of 0.05 eV/Å for the maximum forces acting on atoms. The most interesting structures were re-optimized using also methylthiolate SCH<sub>3</sub> ligand in order to check the effect of a sterically slightly more demanding ligand, particularly the SR *cis-trans* conformers within a given Au-S framework structure. Structural optimizations were done at the LDA level since this has been shown previously to reproduce the Au-Au distances well as compared to the existing crystal structures of Au<sub>102</sub>(SR)<sub>44</sub>, Au<sub>25</sub>(SR)<sub>18</sub>, and Au<sub>38</sub>(SR)<sub>24</sub>. Total energies were calculated with GGA-PBE (gradient-corrected functional of Perdew, Burke, and Ernzerhof ).<sup>3</sup> Linear optical absorption and circular dichroism (CD) spectra were calculated with the PBE level using linear-response (LR) time-dependent DFT (LR-TDDFT) formalism in GPAW.

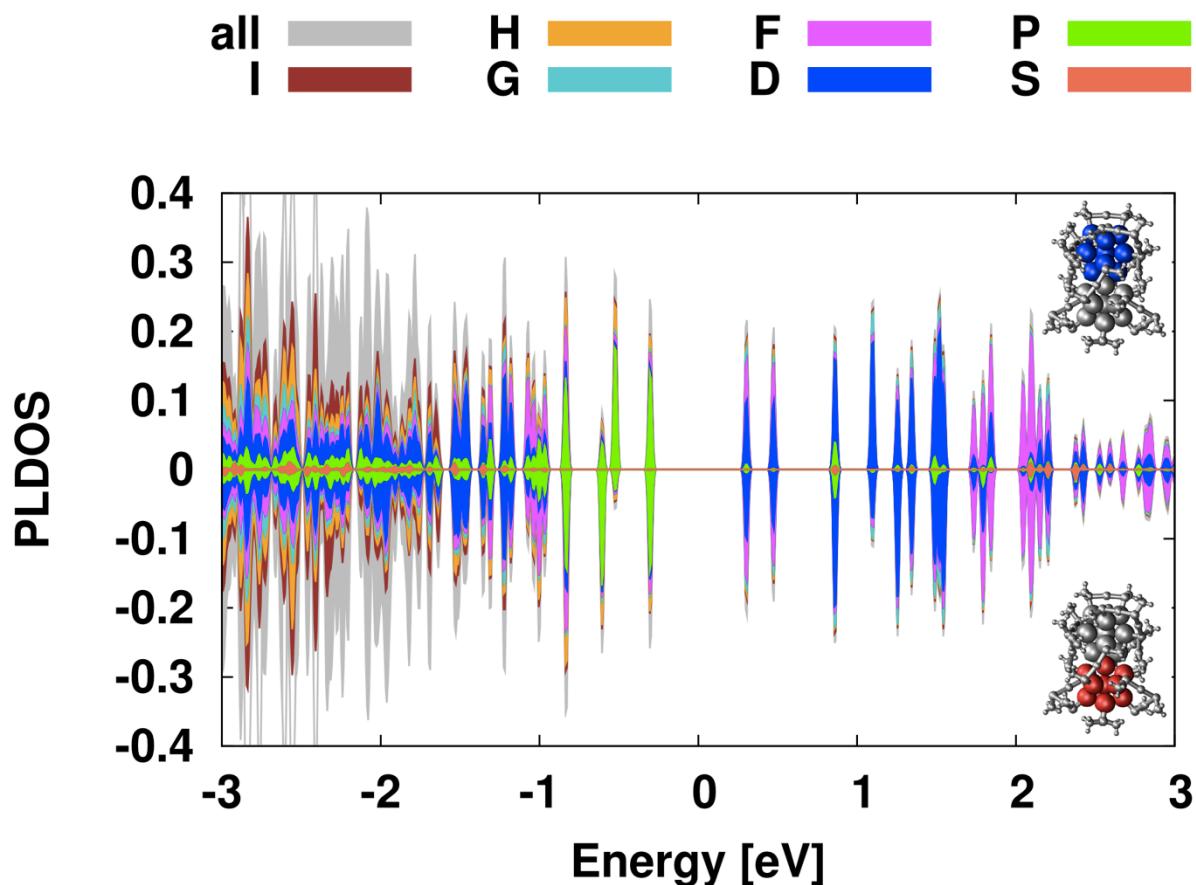

For analysis of the electron states, projection of the Kohn-Sham states to spherical harmonics was done according to in Ref. 4. Projection analysis was done for the energetically best A1 structure in two parts including separately both of the two edge-connected 13 Au-atom icosahedra of the 26 atom cluster core.

## 2. Energetics and HOMO-LUMO gaps

	<b>A1</b>	<b>A2</b>	<b>B1</b>	<b>B2</b>	<b>oblate</b>	<b>tetra</b>
$\Delta E$	0 / 0	0.07/0.32	0.10/0.42	0.22/1.05	1.57 / na	2.58 / na
$E_g^{HL}$	0.67/0.70	0.71/0.69	0.65/0.57	0.82/0.69	0.52 / na	0.23 / na

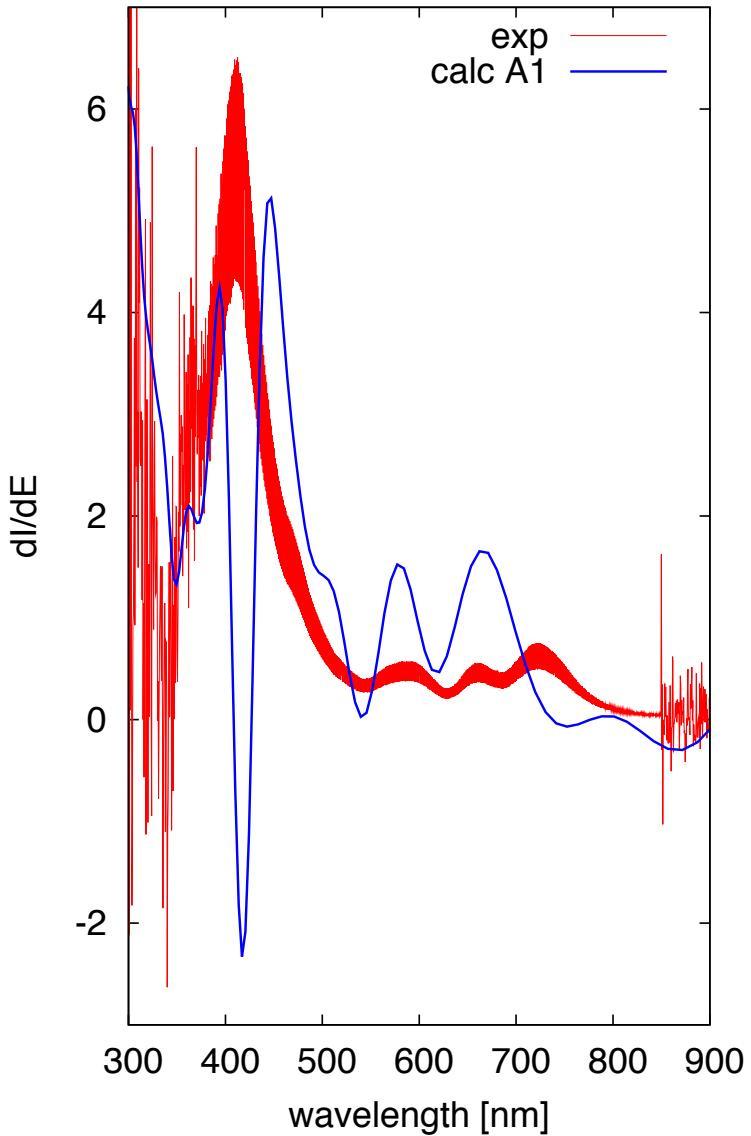

**Table S1.** Relative energies and HOMO-LUMO gaps (in eV) of structures **A1**, **A2**, **B1**, **B2**, and oblate and tetrahedral structures shown in Figure S4. In each entry, the first / second number refers to calculation with SH / SCH<sub>3</sub> ligand, respectively (oblate and tetrahedral clusters were calculated only with the SH ligand).

### 3. Analysis of electronic structure of A1

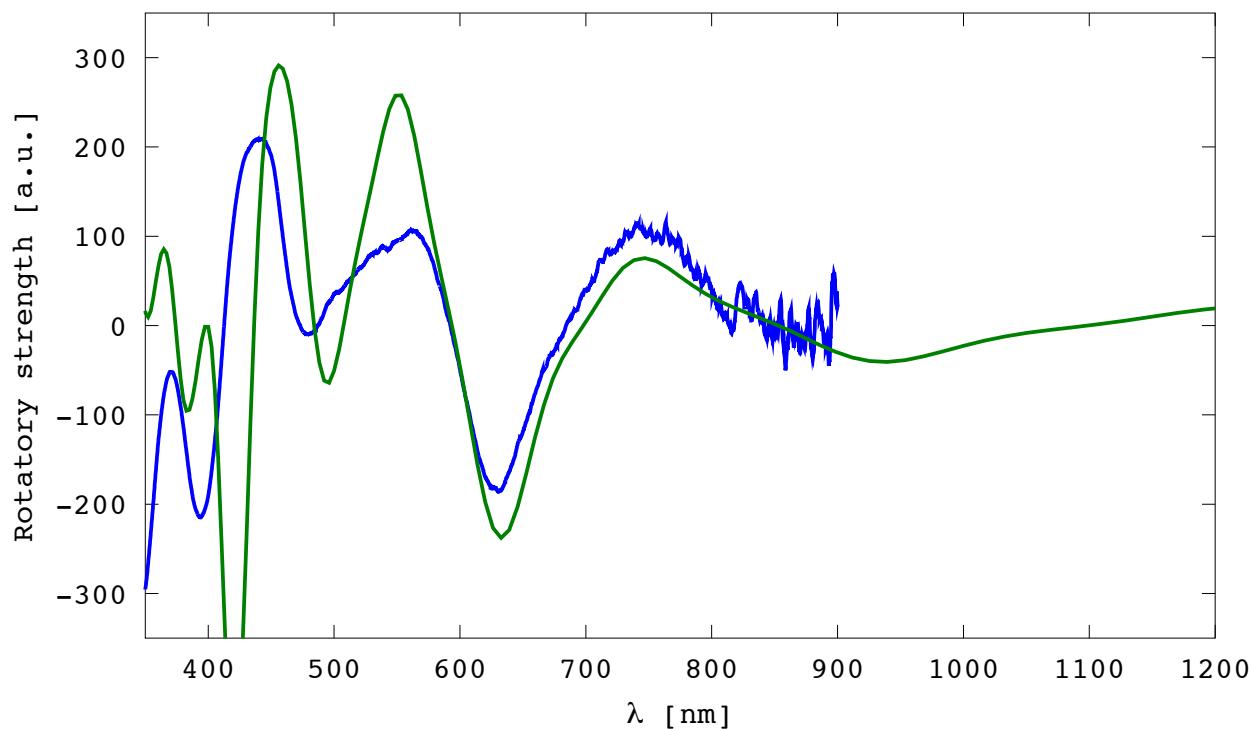

**Figure S1.** Projected local density of electron states (PLDOS) on the two  $\text{Au}_{13}$  icosahedral units (blue, upper panel; red, lower panel) of the core of structure A1. The details of the projection are discussed in ref. 4. The HOMO-LUMO gap of the cluster is centered around  $E = 0$ . The three P-like states just below the gap and opening of the D-like states just above the gap signify both icosahedral units having 8 shell electrons.

#### 4. Derivative optical spectra

**Figure S2.** Derivative of the optical absorption spectrum (red, from ref. 22 of the main text) and of the calculated LR-TDDFT spectrum for structure A1 (blue). In the theoretical spectrum the single transitions have been folded by 0.1 eV Gaussians. The maxima in the data correspond to the most rapid changes in the slope of the corresponding spectra. These changes are seen to agree quite well in the range of 400 – 700 nm. The experimental data becomes noisy for the range above 850 nm where the theoretical spectrum has weak features.

## 5. $\text{Au}_{38}(\text{SR})_{24}$ CD spectra

**Figure S3.** Calculated CD spectrum of  $\text{Au}_{38}(\text{SCH}_3)_{24}$  (green) from LR-TDDFT by using GPAW as compared to the recently measured CD signal (blue) from an enantiopure solution of  $\text{Au}_{38}(2\text{-PET})_{24}$  (ref. 30 of the main text). The structure of  $\text{Au}_{38}(\text{SCH}_3)_{24}$  was taken from ref. 13 of the main text.

## 6. Synthesis and characterization of $\text{Au}_{40}(2\text{-PET})_{24}$

$\text{Au}_{40}(2\text{-PET})_{24}$  clusters were prepared as described earlier.<sup>5</sup> Briefly, *L*-glutathionate-protected gold clusters were prepared in water and methanol by reduction of Au(III) with sodium borohydride in the presence of *L*-glutathione. The resulting clusters precipitated from the reaction mixture and were collected by centrifugation. The clusters were re-dissolved in water and mixed with neat 2-PET and acetone (the latter is to facilitate the phase transfer). The mixture was heated to 80 °C for 3 h, during which the clusters were transferred into the organic phase. After this, excess thiol was removed by extensive washing with methanol. The reaction mixture contains  $\text{Au}_{38}(2\text{-PET})_{24}$ ,  $\text{Au}_{40}(2\text{-PET})_{24}$  and clusters of higher mass. Au40 cluster was isolated by Size-Exclusion Chromatography.<sup>6</sup> The purity of the sample was confirmed with MALDI mass spectrometry (performed by Amal Dass, Univ. of Mississippi, USA) as reported earlier.<sup>6</sup>

All chemical were delivered from standard suppliers and used without further purification. Nanopure water (> 18 MΩ) was used.

Near Infrared-VISIBLE spectra were measured on a JASCO J-670 spectrometer using chloroform as solvent. Quartz cuvettes with a path-length of 1 mm were used.

## 7. HAADF-STEM imaging and analysis

The monolayer-protected clusters were imaged with an aberration-corrected STEM after drop casting onto grids. The microscope employed was a JEM2100F STEM (JEOL) which is equipped with a high-angle annular dark field (HAADF) detector and a spherical aberration( $C_s$ ) probe corrector (CEOS). The electron beam energy was 200kV. The HAADF detector was used to collect signal scattered between an inner angle 62 mrad and outer angle 164 mrad(camera length of 10cm). The experiment is similar to the previous conducted study of monolayer-protected  $\text{Au}_{38}$  clusters.<sup>7,8</sup>

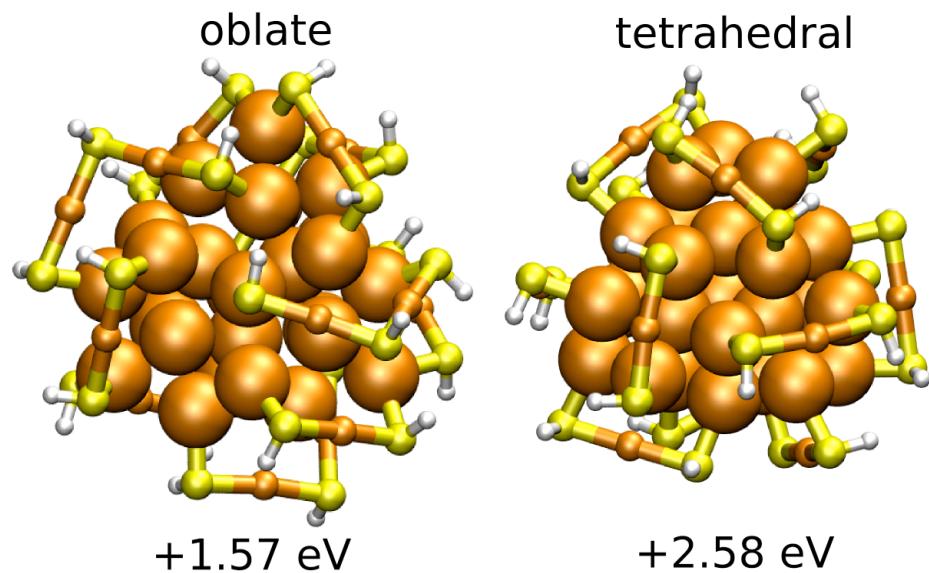

In the main text, Figure 2(a) is a plot of the measured HAADF intensities of each cluster as a function of the measured aspect ratios. The aspect ratio was obtained from a “Fit Ellipse” module in the software package ImageJ.<sup>9</sup> Figure 2(b) is a histogram of the HAADF intensities. It shows a major peak, which we assign to monolayer-protected  $\text{Au}_{40}$  monomers and a much weaker peak at higher intensity that corresponds to dimers. By making a Gaussian fit to the main peak we can exclude anomalies from the aspect ratio all the particles outside two standard deviations from the mean intensity (as shown by the dotted lines in Figure 2(a)). The aspect ratios of the clearly monomeric nanoparticles are then plotted in Figure 2(c) divided into bins of size 0.01.

The range of the aspect ratios may be interpreted in terms of different orientation of an ellipsoidal on the support. Thus, on this model the maximum measured aspect ratio of 1.8-2.1 corresponds to the actual aspect ratio of the monolayer-protected  $\text{Au}_{40}$  clusters. This should be compared to a value of about 1.5 obtained previously for  $\text{Au}_{38}$ .<sup>8</sup>
