## Part I: General Information:

All reactions were carried out in oven or flame-dried glassware under argon atmosphere. $\mathrm{N}, \mathrm{N}-$ dimethylformamide and dimethylsulfoxide were distilled over calcium hydride and stored over $4 \AA$ molecular sieves. $n$-Butyllithium was purchased from Aldrich and was standardized by titration with menthol $/ 2,2^{\prime}$-dipyridyl. All other reagents were used as supplied. Dichloromethane, toluene, diethyl ether, benzene, tetrahydrofuran, and acetonitrile were obtained from a dry solvent system (alumina) and used without further drying. Other ACS grade solvents were purchased from Clean Harbors. Unless otherwise noted, reactions were magnetically stirred and monitored by thin layer chromatography with Macherey Nagel Polygram 0.20 mm silica gel $60 \AA$ plates. Analytical thin layer chromatography was performed using 0.25 mm silica gel $60-\mathrm{F}$ plates. Flash chromatography was performed on Sorbent Technologies 32-63 $\mu \mathrm{m} 60 \AA$ silica gel. Yields referred to chromatographically and spectroscopically pure compounds, unless otherwise noted. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were taken in $\mathrm{CDCl}_{3}$ at 400 or 500 MHz (as indicated) respectively, unless otherwise noted. Chemical shifts are reported in parts per million relative to $\mathrm{CDCl}_{3}\left({ }^{1} \mathrm{H}, \delta 7.24 ;{ }^{13} \mathrm{C}, \delta 77.0\right)$. Data are reported as follows: chemical shift, multiplicity ( $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, q $=$ quartet, sept $=$ septuplet, $\mathrm{m}=$ multiplet, $\mathrm{br}=$ broad), coupling constant, integration. Diastereomeric ratios were determined by ${ }^{1} \mathrm{H}$ NMR analysis of crude mixtures operating at a signal/noise ratio of 200:1. Infrared resonance spectra were recorded on a Nexus 670 FT-IR spectrometer. Optical rotations were recorded on an Autopol III digital polarimeter at 589 nm and reported as follows: $[\alpha]^{20}{ }_{\mathrm{D}}$ (concentration in $\mathrm{g} / 100 \mathrm{~mL}$ solvent and solvent). High resolution mass-spectra were obtained on a Waters Q-TOF mass spectrometer at Boston University Chemical Instrumentation Center (CIC).

## Part II : Control Experiments

## Supplementary Scheme S1: Control Experiments to Support the Dimerization Process

To support the production of dimer products, a control experiment was conducted using a mixture of silanes $\mathbf{1 4 h}$ and $\mathbf{1 4 i}$ (ratio $1: 1$ ). Under Lewis acid promotion, not only homodimers 19a and 19b, but also the hetero-dimer product 19c should be generated in a dimerization process (Scheme S1). As anticipated, the reaction proceeded to deliver the dimerization products. Even though the dimers 19a-19c could not be separated by column chromatography, we could detect the generation of heterodimer 19c using mass spectral analysis (the other two dimers also showed mass hit in the third mass spectrum), thereby supporting the dimerization process.

## i. Preparation of Propargylic Silanes

(2S,3R)-3-(Dimethyl(phenyl)silyl)-1-methoxyhex-4-yn-2-ol (1a): A solution of diethylpropynylaluminum in pentanes ( $0.4 \mathrm{M}, 75 \mathrm{~mL}, 30 \mathrm{mmol}, 3$ equiv) was added into a round bottom flask under an argon atmosphere and cooled to $0^{\circ} \mathrm{C}$. A solution of epoxide 23a ${ }^{1}$

( $2.22 \mathrm{~g}, 10 \mathrm{mmol}, 1$ equiv) in pentanes $(20 \mathrm{~mL})$ was added over 5 minutes. The solution was stirred at room temperature for 12 hours after which time diethyl ether ( 50 mL ) was added followed by the slow addition of an equal volume of a saturated solution of Rochelle's salt. The aqueous portion was then extracted with diethyl ether, combined and dried over $\mathrm{MgSO}_{4}$. The solution was then filtered and concentrated. Further purification over silica gel (hexanes/ethyl acetate: 90/10) afforded the desired propargyl silane $1 \mathrm{a}(2.15 \mathrm{~g}, 82 \%$ yield) as a slightly yellow oil. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 0.39(\mathrm{~s}, 3 \mathrm{H}), 0.42(\mathrm{~s}, 3 \mathrm{H}), 1.82(\mathrm{~d}, J=2.8$ $\mathrm{Hz}, 3 \mathrm{H}), 2.20(\mathrm{~m}, 1 \mathrm{H}), 3.23(\mathrm{~m}, 1 \mathrm{H}), 3.28(\mathrm{~s}, 3 \mathrm{H}), 3.29(\mathrm{~s}, 3 \mathrm{H}), 3.52(\mathrm{~m}, 2 \mathrm{H}), 7.34(\mathrm{~m}, 3 \mathrm{H})$, $7.56(\mathrm{~m}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta-4.2,-3.3,3.8,24.0,58.0,58.8,74.0,76.0,78.3$, $78.8,127.5,128.9,133.7,137.4 \mathrm{ppm}$; IR (neat) vmax: $1113,1246,1428,2918,3069 \mathrm{~cm}^{-1}$; $[\alpha]^{20}=+0.60\left(\mathrm{c}=2.3, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) ; \operatorname{HRMS}\left(\mathrm{CI} / \mathrm{NH}_{3}\right) \mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{16} \mathrm{H}_{24} \mathrm{O}_{2} \mathrm{SiNa}[\mathrm{M}+\mathrm{Na}]^{+}$ 299.1443 , found 299.1436 .

## iii. Alkyne-Alkene Reductive Coupling with Mono-Substituted Olefins

The general procedure for alkyne-alkene reductive coupling between propargyl silanes and mono-substituted olefins: To a solution of propargyl silane 1 ( $262 \mathrm{mg}, 1.0 \mathrm{mmol}, 2$ equiv) in $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ was added sequentially $n-\mathrm{BuLi}(2.5 \mathrm{M}$ in hexanes, $400 u \mathrm{~L}, 1.0 \mathrm{mmol}$, 2 equiv), $\mathrm{ClTi}(\mathrm{OiPr})_{3}\left(1.0 \mathrm{M}\right.$ in hexanes, $2.0 \mathrm{~mL}, 2.0 \mathrm{mmol}, 4$ equiv) and $c-\mathrm{C}_{5} \mathrm{H}_{9} \mathrm{MgCl}(2.0 \mathrm{M}$ in $\mathrm{Et}_{2} \mathrm{O}, 2.0 \mathrm{~mL}, 4.0 \mathrm{mmol}, 8$ equiv) dropwise. The resulting yellow solution turned brown while warming slowly to $0^{\circ} \mathrm{C}$ over 2 hours. The reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for additional 2 hours producing a black solution. To a separate $-78^{\circ} \mathrm{C}$ solution of the monosubstituted olefin ( 0.5 mmol , 1 equiv) in $\mathrm{Et}_{2} \mathrm{O}(2 \mathrm{~mL})$ was added $n-\mathrm{BuLi}(2.5 \mathrm{M}$ in hexanes, $200 u \mathrm{~L}, 0.5 \mathrm{mmol}, 1$ equiv) in a dropwise manner via gas-tight syringe. The resulting solution was warmed to $0{ }^{\circ} \mathrm{C}$, followed by slowly transfer via cannula into the original black solution at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was further stirred at $0^{\circ} \mathrm{C}$ for another 2 hours. The reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution $(10 \mathrm{~mL})$. The mixture was warmed to rt before extractive isolation with diethyl ether ( 3 x 10 mL ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and concentrated under reduced pressure. The residue was purified by preparative thin layer chromatography in the dark, using $30 \%$ or $50 \% \mathrm{EtOAc} / \mathrm{hexanes}$ as developing solvent system. The product band was eluted with EtOAc ( $5 \times 2 \mathrm{~mL}$ ), and the EtOAc was evaporated to obtain the coupled product.

## iv. Alkyne-Alkene Reductive Coupling with disubstituted Olefins

The general procedure for alkyne-alkene reductive coupling between propargyl silanes and disubstituted olefins: To a solution of propargyl silane $\mathbf{1}\left(262 \mathrm{mg}, 1.0 \mathrm{mmol}, 2\right.$ equiv) in $\mathrm{Et}_{2} \mathrm{O}$ $(10 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ was added sequentially $n-\mathrm{BuLi}(2.5 \mathrm{M}$ in hexanes, $400 u \mathrm{~L}, 1.0 \mathrm{mmol}, 2$ equiv), $\mathrm{ClTi}(\mathrm{O} i \operatorname{Pr})_{3}\left(1.0 \mathrm{M}\right.$ in hexanes, $2.0 \mathrm{~mL}, 2.0 \mathrm{mmol}, 4$ equiv) and $c-\mathrm{C}_{5} \mathrm{H}_{9} \mathrm{MgCl}(2.0 \mathrm{M}$ in $\mathrm{Et}_{2} \mathrm{O}, 2.0 \mathrm{~mL}, 4.0 \mathrm{mmol}, 8$ equiv) dropwise. The resulting yellow solution turned brown while warming slowly to $0{ }^{\circ} \mathrm{C}$ over 2 hours. The reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for additional 2 hours producing a black solution. To a separate $-78{ }^{\circ} \mathrm{C}$ solution of the disubstituted olefin ( 0.5 mmol , 1 equiv) in $\mathrm{Et}_{2} \mathrm{O}(2 \mathrm{~mL})$ was added $n-\mathrm{BuLi}(2.5 \mathrm{M}$ in hexanes, $200 u \mathrm{~L}, 0.5 \mathrm{mmol}, 1$ equiv) in a dropwise manner via gas-tight syringe. The resulting solution was warmed to $0{ }^{\circ} \mathrm{C}$, followed by slowly transfer via cannula into the original black solution at $0^{\circ} \mathrm{C}$. The reaction mixture was further stirred at room temperature for another 1 to 3 hours. The reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution $(10 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. The mixture was warmed to rt before extractive isolation with diethyl ether ( $3 \times 10 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and concentrated under reduced pressure. The residue was purified by preparative thin layer chromatography in the dark, using $40 \% \mathrm{EtOAc} /$ hexanes as developing solvent system. The product band was eluted with EtOAc ( $5 \times 2 \mathrm{~mL}$ ), and the EtOAc was evaporated to obtain the coupled product.

## v. The Experimental Procedure for Mono-Oxidation

General procedure I for the selective mono-oxidation of allylsilane diols: To a stirred solution of the allylsilane diol ( 0.5 mmol , 1 equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ at room temperature was added iodobenzenediacetate ( $193 \mathrm{mg}, 0.6 \mathrm{mmol}, 1.2$ equiv) followed by TEMPO ( $20 \mathrm{mg}, 0.125$ mmol, 0.25 equiv) and allowed the reaction mixture to stir further for another 7 hours. After
this reaction was quenched with saturated $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ solution and saturated $\mathrm{NaHCO}_{3}$ solution, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 10 \mathrm{~mL})$ and the combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and concentrated under reduced pressure. The residue was purified by preparative thin layer chromatography in the dark, using $20 \%$ EtOAc/hexane as developing solvent system. The product band was eluted with EtOAc ( $5 \times 2 \mathrm{~mL}$ ), and the EtOAc was evaporated to obtain the aldehyde product.

General procedure II for the selective mono-oxidation of allylsilane diols: To a stirred solution of the benzylic alcohol ( $0.5 \mathrm{mmol}, 1$ equiv) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ at room temperature was added activated $\mathrm{MnO}_{2}$ ( $645 \mathrm{mg}, 7.5 \mathrm{mmol}, 15$ equiv) and allowed the reaction mixture to stir further for another 12 hours. After this reaction was filtered through celite, and washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $3 \times 10 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and concentrated under reduced pressure. ## vi. [3 + 2] Annulation of Complex Silyl Aldehydes

General procedure for the [3+2] annulation: Aldehyde $\mathbf{1 4}$ ( $0.2 \mathrm{mmol}, 1$ equiv) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$. The solution was cooled to $-30^{\circ} \mathrm{C}$ under an argon atmosphere. $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$ ( $50 \mu \mathrm{~L}, 0.4 \mathrm{mmol}, 2$ equiv) was added to the mixture at -30 or $-40^{\circ} \mathrm{C}$, and the solution was stirred at that temperature for 1 to 1.5 hours. The reaction was diluted with a solution of saturated $\mathrm{NaHCO}_{3}(10 \mathrm{~mL})$ and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 10$ mL ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and concentrated under reduced pressure. The residue was purified by preparative thin layer chromatography in the dark, using $30 \%$ EtOAc/hexane as the developing solvent system. The product band was eluted with EtOAc ( $5 \times 2 \mathrm{~mL}$ ), and the EtOAc was evaporated to obtain the bicyclic product 9 .

Aldehyde $\mathbf{1 4 h}$ or $\mathbf{1 4 i}$ ( 0.1 mmol , 1 equiv) was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 1 mL ). The solution was cooled to $-50{ }^{\circ} \mathrm{C}$ under an argon atmosphere. $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}(25 \mu \mathrm{~L}, 0.2 \mathrm{mmol}, 2$ equiv $)$ was added to the mixture at $-50^{\circ} \mathrm{C}$, and the solution was stirred at that temperature for 2 hours. A solution of saturated $\mathrm{NaHCO}_{3}(2 \mathrm{~mL})$ was added and the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $3 \times 5 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered and concentrated under reduced pressure. The proton assignment on ${ }^{1} \mathrm{H}$ NMR of $\mathbf{1 0 b}$ was confirmed by GCOSY NMR analysis. As shown above, the NOE measurement indicated that $\mathrm{H}^{1}$ and $\mathrm{H}^{2}$ has NOE with each other, but no NOE was observed between $\mathrm{H}^{1}$ and $\mathrm{Me}^{1}$ group, thus indicated the cis configuration of $\mathrm{Me}^{1}$ and OH groups on cyclopantane 10b.
