## General Information

Glassware was oven-dried for at least 6 h at $110^{\circ} \mathrm{C}$ or flame dried prior to use. All reactions were performed under inert atmosphere (dry nitrogen or argon) unless otherwise noted. Analytical thinlayer chromatography was performed using 0.25 nm coated commercial silica gel plates (EMD Chemicals, silica gel 60 F254). Silica gel flash chromatography was performed using Silicycle silica gel (230-400 Mesh). Proton and carbon nuclear magnetic resonance spectra ( ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR) were acquired on a Inova-300 ( 300 MHz ), Mercury $400(400 \mathrm{MHz}$ ), or Varian Unity Inova-500 (500 MHz ) spectrometer. Chemical shifts are reported in parts per million ( ppm ) relative to deuterochloroform ( 7.26 ppm for ${ }^{1} \mathrm{H}$ NMR and 77.23 ppm for ${ }^{13} \mathrm{C}$ NMR). Coupling constants ( $/$ ) are quoted in Hz to the nearest 0.5 Hz . Splitting patterns are reported as: s, singlet; d, doublet; t, triplet; q, quartet, m, multiplet, etc. Melting points (uncorrected) were measured using a Thomas Hoover Capillary Melting Point Analysis. Infrared (IR) spectra were recorded as a thin film on NaCl plates with a Thermo Scientific Nicolet IR 100 FT-IR. Chiral HPLC analyses were performed on a Thermo Separation Products spectra series P-100 or P-200 pump and a UV100 detector ( 254 nm or 220 nm ) using a Chiralpak IA. IB, or IC column eluted with the indicated solvent mixture and a flow rate of $1 \mathrm{~mL} \mathrm{~min}^{-1}$. Optical rotations were measured on a Jasco DIP-1000 digital polarimeter using 5 cm cells and the sodium D line ( 589 nm ) at ambient temperature in methylene chloride. High resolution mass spectra were obtained from Stanford University using positive electrospray ionization (ESI+).

## Compound Synthesis

Dimethyl 1-(4-methoxyphenyl)-8,8-dimethyl-6,10-dioxo-4-vinyl-7,9-dioxaspiro[4.5]decane-2,2dicarboxylate 5a

An oven-dried reaction tube equipped with a stir bar was charged with palladium dibenzylideneacetone-chloroform complex ( $2.0 \mathrm{mg}, 0.002 \mathrm{mmol}$ ) and $(R, R)-\mathbf{L}_{1}$ chiral ligand, $(4.0 \mathrm{mg}$, 0.006 mmol ). A second reaction tube, also equipped with a stir bar, was charged with dimethyl 2 -vinylcyclopropane-1,1-dicarboxylate $\mathbf{1}(20.0 \mathrm{mg}, \quad 0.109 \mathrm{mmol})$, 5-(4-methoxybenzylidene)-2,2-dimethyl-1,3-dioxane-4,6-dione 4 ( $35.0 \mathrm{mg}, 0.133 \mathrm{mmol}$ ) and 1,3,5-trimethoxybenzene ( 5.0 mg , $0.03 \mathrm{mmol})$. Both tubes were sealed with a septum, evacuated, and backfilled with dry nitrogen. Toluene (degassed by sparging with nitrogen for 30 min ) was added to the first tube ( 1 mL ) and second tube ( 1 mL ), and the tubes were for stirred 20 min . ## Appendix A - Crystal Structure of compound 5c

The compound crystallizes as colorless rod-like crystals from a chloroform / hexanes solution. There are three crystallographically independent, yet chemically identical, molecules of the compound in the asymmetric unit of the primitive, acentric, orthorhombic space group $\mathrm{P} 2_{1} 2_{1} 2_{1}$. The correct enantiomorph and handedness of the molecules was determined by comparison with the known handedness and by comparison of intensities of Friedel pairs of reflections. Both techniques agree and the correct configuration is depicted in the Figures. The Flack analysis, determined by comparison of intensities of Friedel pairs of reflections yields a Flack $x$ parameter of -0.01(6); a value of zero indicates the correct enantiomorph, a value of one the inverted absolute structure. Bayesian statistical analysis was also performed on the data yielding a Hooft $y$ parameter of $-0.021(16)$, with values of zero representing the correct configuration and one the inverted absolute configuration. P 2 (true) and P3(true) values of 1.000 and 1.000 are also reported. These values are a measure of enantiopurity of the sample analyzed. A value of one indicates an enantiopure crystal.

The structure of the compound is as expected. The three independent molecules all exhibit the same configuration at C5 (C29, C53). The primary difference between all three molecules is that one molecule has adopted an opposite direction to the partial boat conformation of one of the rings (molecule 1 adopts the opposite geometry, see Figures). Otherwise the three molecules are essentially identical and their derived parameters (bond distances and angles) are well within statistical error and support this.

## CRYSTAL SUMMARY

Crystal data for $\mathrm{C}_{24} \mathrm{H}_{26} \mathrm{O}_{9} ; \mathrm{M}_{\mathrm{r}}=458.45$; Orthorhombic; space group $\mathrm{P}_{1} 2_{1} 2_{1} ; a=6.9048(2) \AA ; b=$ $30.4010(9) \AA ; c=32.6302(9) \AA ; \alpha=90^{\circ} ; \beta=90^{\circ} ; \gamma=90^{\circ} ; \mathrm{V}=6849.5(3) \AA^{3} ; \mathrm{Z}=12 ; \mathrm{T}=120(2) \mathrm{K} ;$ $\lambda(\mathrm{Cu}-\mathrm{K} \alpha)=1.54184 \AA ; \mu(\mathrm{Cu}-\mathrm{K} \alpha)=0.860 \mathrm{~mm}^{-1} ; \mathrm{d}_{\text {calc }}=1.334 \mathrm{~g} . \mathrm{cm}^{-3} ; 136106$ reflections collected; 12961 unique ( $\mathrm{R}_{\text {int }}=0.0306$ ); giving $\mathrm{R}_{1}=0.0296, \mathrm{wR}_{2}=0.0800$ for 12840 data with $[I>2 \sigma(\mathrm{I})]$ and $\mathrm{R}_{1}$ $=0.0299, \mathrm{wR}_{2}=0.0803$ for all 12961 data. Residual electron density $\left(\mathrm{e}^{-} . \AA^{-3}\right) \mathrm{max} / \mathrm{min}: ~ 0.395 /-0.168$.

An arbitrary sphere of data were collected on a colorless rod-like crystal, having approximate dimensions of $0.38 \times 0.22 \times 0.14 \mathrm{~mm}$, on a Bruker APEX-II diffractometer using a combination of $\omega$ - and $\varphi$-scans of $0.5^{\circ}$. Data were corrected for absorption and polarization effects and analyzed for space group determination. The structure was solved by direct methods and expanded routinely. The model was refined by full-matrix least-squares analysis of $\mathrm{F}^{2}$ against all reflections. All non-hydrogen atoms were refined with anisotropic thermal displacement parameters. Unless otherwise noted, hydrogen atoms were included in calculated positions. Thermal parameters for the hydrogens were tied to the isotropic thermal parameter of the atom to which they are bonded $(1.5 \times$ for methyl, 1.2 $\times$ for all others).

## Appendix B - Crystal Structure of compound 15

The compound crystallizes as colorless block-like crystals from a solvent mixture of chloroform, ethyl acetate, diethyl ether, benzene and pentane. There are two crystallographically independent, yet chemically identical, molecules of the compound in the asymmetric unit of the primitive, acentric, orthorhombic space group $\mathrm{P} 2_{1} 2_{1} 2_{1}$.

Two methods of determining the absolute stereochemistry were applied to the data. The comparison of intensities of Friedel pairs of reflections gave an absolute structure parameter (Flack parameter) of $0.002(6)$. A value of zero indicates the correct enantiomorph of the space group; a value of one the inverted absolute stereochemistry. The second analysis is the Hooft analysis (see additional article for further information). The Hooft $y$ parameter was measured to be: 0.009(6) (a value of zero indicates the correct stereochemistry) and the P2(true) and P3(true) values (measures of racemic twin components) were both 1.000 , indicating no racemic twinning within the sample. The correct absolute stereochemistry is depicted in the Figures.

The structure of each of the two molecules is essentially identical and only differs in that one of the two molecules has some disorder present in one of the acetyl groups (C24A/C24B). The other differences are changes in torsional angles. They are otherwise identical in connectivity and stereochemistry. Significant differences are the orientation of the vinyl group and the orientation of the major component of the disordered acetyl with respect to the ordered molecule.

The structure of the molecules is as expected. The two independent amide moieties form H -bonds to nearby acceptor atoms. N1 forms an H-bond to the amide oxygen, O1A, of a neighboring molecule while the second molecule (N1A) forms an H-bond to an acetyl oxygen (O4) of a symmetry related "first" molecule. This results in a one-dimensional chain of molecules that run through the lattice parallel to the $c$-axis.

The disorder was refined with the two components having an occupancy summed to unity, giving an approximately $0.64: 0.36$ occupancy ratio. This disorder does have some effect on the C-O bond distances of the acetyl group, resulting in an average of the single and double-bond character.

## CRYSTAL SUMMARY

Crystal data for $\mathrm{C}_{26} \mathrm{H}_{26} \mathrm{BrNO}_{7} ; \mathrm{M}_{\mathrm{r}}=544.3$; Orthorhombic; space group $\mathrm{P}_{1} 2_{1} 2_{1} ; a=11.9755(7) \AA ; b$ $=19.1059(12) \AA ; c=22.4599(14) \AA ; \alpha=90^{\circ} ; \beta=90^{\circ} ; \gamma=90^{\circ} ; \mathrm{V}=5138.9(5) \AA^{3} ; Z=8 ; \mathrm{T}=120(2)$ $\mathrm{K} ; \lambda(\mathrm{Mo}-\mathrm{K} \alpha)=0.71073 \AA ; \mu(\mathrm{Mo}-\mathrm{K} \alpha)=1.644 \mathrm{~mm}^{-1} ; \mathrm{d}_{\text {calc }}=1.407 \mathrm{~g} \cdot \mathrm{~cm}^{-3} ; 67562$ reflections collected; 10488 unique $\left(\mathrm{R}_{\text {int }}=0.0817\right)$; giving $\mathrm{R}_{1}=0.0392$, $\mathrm{wR}_{2}=0.0749$ for 8071 data with $[I>2 \sigma(\mathrm{I})]$ and $\mathrm{R}_{1}$ $=0.0671, \mathrm{wR}_{2}=0.0900$ for all 10488 data. Residual electron density $\left(\mathrm{e}^{-} . \AA^{-3}\right) \mathrm{max} / \mathrm{min}: ~ 0.410 /-0.428$.

An arbitrary sphere of data were collected on a colorless block-like crystal, having approximate dimensions of $0.38 \times 0.19 \times 0.12 \mathrm{~mm}$, on a Bruker Kappa X8-APEX-II diffractometer using a combination of $\omega$ - and $\varphi$-scans of $0.5^{\circ}$. Data were corrected for absorption and polarization effects and analyzed for space group determination. The structure was solved by direct methods and expanded routinely. The model was refined by full-matrix least-squares analysis of $\mathrm{F}^{2}$ against all reflections. All non-hydrogen atoms were refined with anisotropic thermal displacement parameters. Unless otherwise noted, hydrogen atoms were included in calculated positions. Thermal parameters for the hydrogens were tied to the isotropic thermal parameter of the atom to which they are bonded ( $1.5 \times$ for methyl, $1.2 \times$ for all others).
