## 1. General

${ }^{1} \mathrm{H}$ NMR spectra were recorded on commercial instruments ( 300 MHz or 400 MHz ). Chemical shifts were reported in ppm from tetramethylsilane with the solvent resonance as the internal standard $\left(\mathrm{CDCl}_{3}: \delta=7.26\right)$. Spectra were reported as follows: chemical shift ( $\delta \mathrm{ppm}$ ), multiplicity ( $\mathrm{s}=$ singlet, d $=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{p}=$ quintet, $\mathrm{m}=$ multiplet, $\mathrm{w}=$ wide $)$, coupling constants $(\mathrm{Hz})$ and integration. ${ }^{13} \mathrm{C}$ NMR spectra were collected on commercial instruments ( 75 MHz or 100 MHz ) with complete proton decoupling. Chemical shifts were reported in ppm from the tetramethylsilane with the solvent resonance as internal standard $\left(\mathrm{CDCl}_{3}: \delta=77.0\right)$. The enantiomeric excesses were determined by HPLC analysis on chiral Daicel Chiralcel AS-H, AD-H and OD-H columns in comparison with the authentic racemates and chiral GC analysis. ESI-HRMS spectra were recorded on a commercial apparatus and methanol or acetonitrile was used to dissolve the sample. Reagents obtained from commercial sources were used without further purification. $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ were distilled over $\mathrm{CaH}_{2}$ before use. THF and other solvents were distilled from sodium benzophenone ketyl before use. The $N, N^{\prime}$-dioxdes were prepared according to the methods reported in the literature. ${ }^{[1]}$
2. General procedure for the preparation of the racemic products

Desymmetrization of meso-cyclic ketones: The reactions were performed with prochiral ketones $\mathbf{1}$ or $3(0.10 \mathrm{mmol})$ and $m$-chlorobenzoperoxoic acid ( $m$-CPBA) ( 0.12 mmol ) in EtOAc ( 1.0 mL ). The mixtures were stirred at $35{ }^{\circ} \mathrm{C}$ for 18 h . After that the saturated $\mathrm{K}_{2} \mathrm{CO}_{3}$ solution $(10 \mathrm{~mL})$ was added and the organic layers were extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 5 \mathrm{~mL})$. Then the organic layers were concentrated in vacuo and the crude products were purified directly by column chromatography on silica gel (petroleum ether/EtOAc $=4 / 1$ or $8 / 1$ ) to afford the corresponding product.
Kinetic resolution of racemic cyclohexanones: The reactions were performed with racemic ketones 7 $(0.10 \mathrm{mmol})$, racemic catalyst solution prepared beforehand $\left(0.005 \mathrm{mmol} \mathrm{Sc}(\mathrm{OTf})_{3} / \mathbf{L} 2_{\text {rac }}\right.$ in 1.0 ml of EtOAc, $5 \mathrm{~mol} \%$ catalyst loading) in a dry reaction tube. Then $m$-CPBA ( 0.12 mmol in 1.0 ml of EtOAc) was added at $-20^{\circ} \mathrm{C}$. After the reaction mixtures were stirred for 36 h at $-20^{\circ} \mathrm{C}$, the saturated $\mathrm{K}_{2} \mathrm{CO}_{3}$ solution ( 10 mL ) was added and the organic layers were extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 5 \mathrm{~mL})$. Then the combined organic layers were concentrated in vacuo and the crude products were purified directly by column chromatography on silica gel (petroleum ether/EtOAc $=4 / 1$ ) to afford the desired products 8.

## 3. General experimental procedures for the catalytic asymmetric Baeyer-Villiger Oxidation

Preparation of the chiral catalyst solution: $N, N^{\prime}$-dioxide $\mathbf{L} 3(39.0 \mathrm{mg}, 0.05 \mathrm{mmol})$ and scandium triflate ( $24.5 \mathrm{mg}, 0.05 \mathrm{mmol}$ ) were stirred in 10.0 mL of EtOAc at $35^{\circ} \mathrm{C}$ for 30 min .
Desymmetrization of meso-cyclic ketones: The reactions were performed with ketones $\mathbf{1}$ or $\mathbf{3}$ (0.10 $\mathrm{mmol})$, chiral catalyst solution prepared beforehand $\left(0.005 \mathrm{mmol} \mathrm{Sc}(\mathrm{OTf})_{3} / \mathrm{L}\right.$ in 1.0 ml of EtOAc, 5 $\mathrm{mol} \%$ catalyst loading) in a dry reaction tube. Then $m$-CPBA ( 0.12 mmol in 1.0 ml of EtOAc) was added at -20 or $-60^{\circ} \mathrm{C}$. After the reaction mixtures were stirred for 18 h at -20 or $-60{ }^{\circ} \mathrm{C}$, the saturated $\mathrm{K}_{2} \mathrm{CO}_{3}$ solution ( 10 mL ) was added and the organic layers were extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 5 \mathrm{~mL})$. Then the combined organic layers were concentrated in vacuo and the crude products were purified directly by column chromatography on silica gel (petroleum ether/EtOAc $=4 / 1$ or $8 / 1$ ) to afford the desired products 2 or 4.
Kinetic resolution of racemic cyclohexanones: The reactions were performed with racemic ketones 7 $(0.10 \mathrm{mmol})$ and $\mathrm{Al}\left(\mathrm{O}^{i} \operatorname{Pr}\right)_{3}(0.1 \mathrm{mmol}, 20.0 \mathrm{mg}$, purity: $99.99 \%)$ in a dry reaction tube, then the chiral catalyst solution prepared beforehand $\left(0.005 \mathrm{mmol} \mathrm{Sc}(\mathrm{OTf})_{3} / \mathrm{L}\right.$ in 1.0 ml of EtOAc, $5 \mathrm{~mol} \%$ catalyst loading) and $m$-CPBA ( 0.10 mmol in 1.0 ml of EtOAc) was added at the indicated temperature. After the reaction mixtures were stirred for the indicated time, the saturated $\mathrm{K}_{2} \mathrm{CO}_{3}$ solution $(10 \mathrm{~mL})$ was added and the organic layers were extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 5 \mathrm{~mL})$. Then the combined organic layers were concentrated in vacuo and the crude products were purified directly by column chromatography on silica gel (petroleum ether/EtOAc $=4 / 1$ ) to afford the desired abnormal lactones $\mathbf{8 / 9}$ and recover the unreacted ketones 7. The lactones $\mathbf{8}$ and $\mathbf{9}$ have the same Rf value and could not be separated by chromatography.
4. Experimental procedure for the synthesis of the 4-substituted cyclohexanones

Experimental procedure for the synthesis of the alcohol 11b-l: The alcohols 11b-l were prepared according to the methods reported in the literature with a minor modification. ${ }^{[2]}$ To magnesium turnings $(0.60 \mathrm{~g}, 49.6 \mathrm{mmol})$ was added a solution of $\mathbf{1 0 b}-1(23.5 \mathrm{mmol})$ dissolved in THF ( 40 mL ). The suspension was stirred and heated at reflux until the formation of the Grignard began. Then the heat was removed and the reaction continued until all of the Mg had reacted. After the flask was cooled to room temperature, a solution of 1,4-cyclohexanedione monoethylene ketal ( $3.50 \mathrm{~g}, 22.4 \mathrm{mmol}$ ) in THF $(40 \mathrm{~mL})$ was added dropwise, and the reaction mixture was heated at reflux for 24 h . The reaction was quenched by the addition of saturated $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{~mL})$, and the resultant mixture was extracted with EtOAc ( $3 \times 50 \mathrm{~mL}$ ). The combined organic layers were washed again with aqueous $\mathrm{NaOH}(20 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{~mL})$. The organic layers were then dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated to give crude solids. The crude products were purified directly by column chromatography on silica gel (petroleum ether/EtOAc $=4 / 1$ ) to afford the desired products 11b-l.
Experimental procedure for the synthesis of the $\mathbf{1 2 b}-\mathbf{l}$ : The products $\mathbf{1 2 b}-1$ were prepared according to the methods reported in the literature with a minor modification. ${ }^{[3]}$ To a solution of 11b-l ( 15.0 mmol )
in pyridine $(85 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added $\mathrm{DBU}(4.5 \mathrm{~mL}, 30.0 \mathrm{mmol})(1,8$-diazabicyclo[5.4.0]undec-7-ene) followed by $\mathrm{POCl}_{3}(2.7 \mathrm{~mL}, 29.5 \mathrm{mmol})$ dropwise. The resultant orange solution was stirred at room temperature for 1 h and at $80^{\circ} \mathrm{C}$ for 90 min during which time the orange color darkened. The solution was cooled to $0{ }^{\circ} \mathrm{C}$, and diluted carefully with $\mathrm{EtOAc}(100 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$. The organic phase was washed with $\mathrm{H}_{2} \mathrm{O}$ and brine, dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated in vacuo to give 12b-l as orange-brown oil. The crude products were purified directly by column chromatography on silica gel (petroleum ether/EtOAc $=8 / 1$ ) to afford the desired pure sample 12b-l.
Experimental procedure for the synthesis of the 13b-l: The pure sample 12b-l from the above reactions was dissolved in $1: 1 \mathrm{MeOH} / E t O A c(25 \mathrm{~mL})$. Palladium ( $10 \%$ on carbon, 0.3 g ) was added. The mixture was stirred for 5 h under hydrogen ( 4 MPa ) and filtered through a pad of Celite ${ }^{\circledR}$. The solvent was evaporated in vacuo to afford the crude products. The crude products were purified directly by column chromatography on silica gel (petroleum ether/EtOAc $=8 / 1$ ) to afford the desired pure sample 13b-l.
Experimental procedure for the synthesis of the cyclohenanones 1b-l: The cyclohexanones 1b-l were prepared according to the methods reported in the literature with a minor modification. ${ }^{[3]}$ The pure sample 13b-l was dissolved in a mixture of THF, water and concentrated sulfuric acid (4:2:1, 70 mL ). The mixture was stirred for 90 min , diluted with brine ( 50 mL ) and extracted with EtOAc ( $3 \times 50 \mathrm{~mL}$ ). The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$ and the solvent evaporated in vacuo. Chromatography of the residue over silica gel, eluting with petroleum ether/EtOAc $=8 / 1$, gave the desired pure sample 1b-l.
5. Experimental procedure for the synthesis of the 3-substituted cyclobutanones

Experimental procedure for the synthesis of the 15a-h: The products $\mathbf{1 5 a}$-h were prepared according to the methods reported in the literature with a minor modification. ${ }^{[4]}$ To a stirred suspension of activated $\mathrm{Zn}-\mathrm{Cu}(1.60 \mathrm{~g}, 25 \mathrm{mmol})$ and $\mathbf{1 4 a}-\mathrm{h}(10 \mathrm{mmol})$ in dry $\mathrm{Et}_{2} \mathrm{O}(20 \mathrm{~mL})$ was added dropwise through an addition funnel, during 2 h at reflux, a solution of trichloroacetic chloride ( $2.2 \mathrm{~mL}, 20 \mathrm{mmol}$ ) and phosphorus oxychloride $(1.9 \mathrm{~mL}, 20 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL})$. The suspension was stirred overnight at reflux. The mixture was cooled to room temperature and then filtered through a pad of Celite. The residue was washed with $\mathrm{Et}_{2} \mathrm{O}(3 \times 15 \mathrm{~mL})$. The organic phase was concentrated in vacuo to give crude products 15a-h, which were routinely used without further purification to the next step.
Experimental procedure for the synthesis of the cyclobutanones 3a-h: The cyclobutanones 3a-h were prepared according to the methods reported in the literature with a minor modification. ${ }^{[4]}$ The solution of the previous crude products $\mathbf{1 5 a}-\mathrm{h}$ in acetic acid $(10 \mathrm{~mL})$ was added dropwise to a vigorously stirred suspension of zinc dust $(2.6 \mathrm{~g}, 40 \mathrm{mmol})$ in acetic acid $(8 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. After the addition, the reaction mixture was heated at $70{ }^{\circ} \mathrm{C}$ for 2 h . The mixture was allowed to cool to room temperature and then evacuated to get rid of most of the acetic acid. The residue was dissolved in $\mathrm{Et}_{2} \mathrm{O}$ $(20 \mathrm{~mL})$ and then poured into a separation funnel containing water $(20 \mathrm{~mL})$ and $\mathrm{Et}_{2} \mathrm{O}(20 \mathrm{~mL})$. The organic layer was washed with water $(3 \times 10 \mathrm{~mL})$, saturated sodium bicarbonate solution $(2 \times 10 \mathrm{~mL})$,
brine ( 50 mL ) and dried over $\mathrm{MgSO}_{4}$. The solution was then filtered and concentrated, followed by purification with flash chromatography (petroleum ether/EtOAc $=8 / 1$ ) to afford the desired pure sample products $\mathbf{3 a - h}$.

## 6. Experimental procedure for the asymmetric synthesis of adipic acid 5

Experimental procedure for the synthesis of the compound 16: The reaction was performed with $\varepsilon$-lactone $2 \mathrm{~m}(0.5 \mathrm{mmol}), \mathrm{KOH}(1.0 \mathrm{mmol})$ and $\mathrm{CH}_{3} \mathrm{OH}(1.0 \mathrm{~mL})$ in a dry tube. After the stirring was continued for 24 h at rt ., HCl solution ( $1.0 \mathrm{~mol} / \mathrm{L}, 10 \mathrm{~mL}$ ) was added. The organic layer was extracted with EtOAc ( $3 \times 15 \mathrm{~mL}$ ). The extract was washed with brine, dried over $\mathrm{NaSO}_{4}$ and concentrated in vacuo, affording the crude product 16. The crude product was not purified and directly used for the next step.
Experimental procedure for the synthesis of the adipic acid 5: The reaction was performed with $\mathbf{1 6}$ $(0.4 \mathrm{mmol})$, Jones reagent $(4.0 \mathrm{~mL})$ and $\mathrm{CH}_{3} \mathrm{COCH}_{3}(5.0 \mathrm{~mL})$ in a dry tube. After the stirring was continued for 24 h at rt ., isopropyl alcohol $(5.0 \mathrm{~mL})$ was added and the organic layer was extracted with EtOAc $(3 \times 15 \mathrm{~mL})$. The extract was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The crude product was purified directly by column chromatography on silica gel (petroleum ether $/ \mathrm{EtOAc}=1 / 1$ ) to afford the desired product adipic acid 5 in $62 \%$ overall yield and $84 \%$ ee value.
Experimental procedure for the synthesis of the compound 17: The reaction was performed with $\mathbf{5}$ $(0.20 \mathrm{mmol}), \mathrm{Et}_{3} \mathrm{~N}(0.44 \mathrm{mmol})$ and isobutyl carbonochloridate $(0.44 \mathrm{mmol})$ with THF $(1.0 \mathrm{~mL})$ in a dry tube. After the stirring was continued for 15 min at $0^{\circ} \mathrm{C}$, the aniline $(0.44 \mathrm{mmol})$ was added. Then stirring was continued for 8 h at $35^{\circ} \mathrm{C}$, the organic layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 15 \mathrm{~mL})$. The extract was washed with brine and concentrated in vacuo. The crude product was purified directly by column chromatography on silica gel (petroleum ether/EtOAc $=1 / 1$ ) to afford the desired product $\mathbf{1 7}$ in $84 \%$ yield and $84 \%$ ee value.

## 7. Extra condition optimizations for the asymmetric Baeyer-Villiger Oxidation
