Table SI 4. Comparison of archaeal and bacterial p-proteome analyses. The comparisons were performed with BLAST-P analyses (<http://blast.ncbi.nlm.nih.gov/Blast.cgi>). Only hits with E-values lower than E⁻¹⁴ are shown.

Comparison of phospho-proteome studies - The comparison of p-proteins identified from prokaryotic p-proteome studies (*E. coli*, *B. subtilis*, *L. lactis*, *H. salinarium*) revealed 29 significant matches (e-value ≤ e-14). According with their phylogenetic distance Bacteria comprise only 3-5 phosphorylated orthologs, whereas the Archaeon *H. salinarium* possesses 15 phosphorylated orthologs. The majority (six) of the orthologs found in *H. salinarium* belongs to the arCOG J (translation) category; the remaining orthologs are distributed in different arCOG categories. Disregarding different experimental set ups and growth conditions isocitrate dehydrogenase (IDH) is phosphorylated in three species (*S. solfataricus*, *H. salinarium* and *E. coli*) highlighting its important function in the regulation of carbon flux into the glyoxylate and TCA cycle (see also TCA cycle).
