Single Crystal X-ray Crystallography

Crystal Structure Reports for structures 1a, 1b, 2, 3, 4, 5, 8, 9, 10a, 10b, 13, 14, 15, 16, R&D1, R&D2, R&D3

Single Crystal X-ray Crystallography

Data collection and structure solution were conducted at the X-ray Crystallographic Laboratory, 160 Kolthoff Hall, Chemistry Department, University of Minnesota.

Crystals were placed onto the tips glass capillary tubes or fibers and mounted on a Siemens or Bruker SMART CCD Platform diffractometer for data collection.¹ For each crystal a preliminary set of cell constants and an orientation matrix were calculated from reflections harvested from three orthogonal wedges of reciprocal space. Full data collections were carried out using MoK α radiation (0.71073 Å, graphite monochromator) with frame times ranging from 5 to 60 seconds and at a detector distance of approximately five cm. Randomly oriented regions of reciprocal space were surveyed: three major sections of frames were collected with 0.30° steps in ω at three different φ settings and a detector position of -28° in 2 θ . The intensity data were corrected for absorption.² Final cell constants were calculated from the xyz centroids of about 4000 strong reflections from the actual data collections after integration.³ See Table 1 for additional crystal and refinement information.

Structures were solved using SIR97⁴ and refined using SHELXL-97.⁵ Space groups were determined based on systematic absences, intensity statistics, or both. Direct-methods solutions were calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. When possible, hydrogen atoms on metal-coordinated carbon atoms were found from the difference Fourier map, and their positional and isotropic displacement parameters were refined independently from those of their bonded carbon atoms. All other hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters.

Full matrix least squares refinements on F^2 were run to convergence.

Structure **3** is a three-dimensional network of potassium cations and $[\text{Co}(\text{PF}_3)_4]^-$ anions.

The formula unit is bisected by a crystallographic mirror plane that contains atoms K1, Co1, P2, and F4. One PF_3 ligand arm (P3, F6, F7, F8) is modeled as disordered over the crystallographic mirror plane (50:50), with all three P-F bond lengths restrained to be similar. The asymmetric unit of **5** contains the $[\text{Co}(\text{P}(O\text{iPr})_3)_4]^-$ anion, with all atoms in general positions, and two independent cation sites, with the potassium metals in crystallographic inversion centers. The anions are well separated from the cations. Both independent potassium-coordinated THF solvent molecules are modeled as disordered, one over two positions (77:23) and one over three positions (44:35:21). Bond lengths in the THF molecules were restrained to ideal values and anisotropic displacement parameters of spatially close atoms were constrained to be equivalent. All atoms in **8** lie in general positions and the cation and anion are well separated. In **9** the cation and anion well separated and both lie along crystallographic two-fold axes; thus one half of each is unique. The cation and anion of **14** are in general positions, and are weakly coordinated via atoms C3 and C4 of the butadiene ligand and via atom C9 of the cyclooctadiene ligand, creating a pseudo polymeric structure in one dimension parallel to the *b*-axis. Likewise in **15** the cation and anion are in general positions and are in contact with each other via atoms of the cyclooctadiene ligand, also producing a pseudo polymeric structure in one dimension. The bipyridine ligand does not associate with the cation.

Structure **16** was run at a higher temperature than usual (223 K versus 173 K) to avoid data that appeared to be between twinned monoclinic and orthorhombic, neither of which offered a satisfactory model. The cations and anions are well separated. The cobalt anion is bisected by a crystallographic mirror plane that contains atoms Co1, C6, N2, C7, C9, C10, N3, and C11. The

ligand containing N1 and the methyl groups of the ligand containing N3 are modeled as disordered over the mirror plane (50:50). The charge is balanced by two independent potassium 18-crown-6 bis(THF) cations in which the potassium atoms lie in crystallographic 2/m positions (four-fold multiplicity). These THF solvent molecules are modeled as doubly disordered, over the mirror plane and over two general positions (50:50, 61:39 and 50:50, 63:37). There was an additional uncoordinated co-crystallized THF solvent molecule that was highly disordered over a crystallographic mirror plane and that could not be modeled satisfactorily. The reflection contribution from this solvent were removed using program *PLATON*, function *Squeeze*,⁶ which determined there to be 152 electrons in 599.6 Å³ removed per unit cell (approximately one THF per cobalt anion). Since the identity of the removed solvent molecule was known, it was included in the molecular formula.

For additional details and for structures introduced in the Results and Discussion section of the article, see the individual reports below.

Crystallographic information files (CIFs) are also available from the Cambridge Crystallographic Data Centre (CCDC) with reference codes CCDC 885955-885971.

Data collection

A crystal ($0.31 \times 0.28 \times 0.23 \text{ mm}^3$) was placed onto the tip of a 0.1 mm diameter glass capillary tube or fiber and mounted on a Siemens SMART Platform CCD diffractometer for a data collection at $173(2) \text{ K}$.¹ A preliminary set of cell constants and an orientation matrix were calculated from reflections harvested from three orthogonal wedges of reciprocal space. The full data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 20 seconds and a detector distance of 4.88 cm. A randomly oriented region of reciprocal space was surveyed: three major sections of frames were collected with 0.30° steps in ω at three different ω settings and a detector position of -28° in 2ω . The intensity data were corrected for absorption.² Final cell constants were calculated from the xyz centroids of 6246 strong reflections from the actual data collection after integration.³ See Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SHELXS-97⁴ and refined using SHELXL-97.⁴ The space group $P2_1/c$ was determined based on systematic absences. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. Hydrogen atoms on metal-coordinated carbon atoms were found from the difference Fourier map, and their positional and isotropic displacement parameters were refined independently from those of their respective bonded atoms. All other hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0320$ ($F^2, I > 2\sigma(I)$) and $wR2 = 0.0780$ (F^2 , all data).

Structure description

The structure is a greatly improved repeat of structure 01005. Per formula unit are one cobalt anion, one bis(triglyme) potassium cation, and one half of an anthracene molecule (uncoordinated) that lies in a crystallographic inversion center. The cobalt-centroid distances (centroids C1-C2-C13-C14 and C15-C16-C27-C28) are 1.64 \AA ; the centroid-Co-centroid angle is 170° . The fold angles are 29.0° and 29.3° , respectively. The coordinated anthracene containing C2 through C13 is twisted with respect to itself by 9.5° (see figure below).

Unless noted otherwise all structural diagrams containing thermal displacement ellipsoids are drawn at the 50 % probability level.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, 160 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using SGI INDY R4400-SC or Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young,

Jr., and the X-Ray Crystallographic Laboratory.

Some equations of interest:

$$R_{\text{int}} = \frac{\sum |F_o^2 - \langle F_o^2 \rangle|}{\sum |F_o^2|}$$

$$R1 = \frac{\sum ||F_o|| - |F_c||}{\sum |F_o|}$$

$$wR2 = [\sum [w(F_o^2 - F_c^2)^2] / \sum [w(F_o^2)^2]]^{1/2}$$

where $w = 1 / [\sum^2 (F_o^2) + (aP)^2 + bP]$ and

$$P = 1/3 \max(0, F_o^2) + 2/3 F_c^2$$

$$\text{GOF} = S = [\sum [w(F_o^2 - F_c^2)^2] / (m-n)]^{1/2}$$

where m = number of reflections and n = number of parameters

CRYSTAL STRUCTURE REPORT

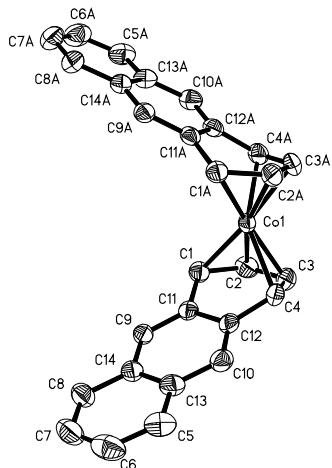

or

Report prepared for:

W. Brennessel, Prof. J. Ellis

November 07, 1999

William W. Brennessel
X-Ray Crystallographic Laboratory
Department of Chemistry
University of Minnesota
207 Pleasant St. S.E.
Minneapolis, MN 55455

Data collection

A crystal (approximate dimensions 0.34 x 0.26 x 0.20 mm³) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Bruker SMART Platform CCD diffractometer for a data collection at 173(2) K.¹ A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 99 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 30 seconds and a detector distance of 4.91 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.77 Å. Three major sections of frames were collected with 0.30° steps in ω at three different ϕ settings and a detector position of -28° in 2θ . The intensity data were corrected for absorption and decay (SADABS).² Final cell constants were calculated from the xyz centroids of 6246 strong reflections from the actual data collection after integration (SAINT).³ Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SHELXS-97⁴ and refined using SHELXL-97.⁴ The space group $C2/c$ was determined based on systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. Hydrogen atoms on carbon atoms C1, C2, C3, and C4 were found from the difference map and refined with individual isotropic displacement parameters. The remaining hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0476$ and $wR2 = 0.1410$ (F^2 , all data).

Structure description

The structure is the one suggested. The cobalt and potassium atoms lie on a two fold axis; thus, one half of the molecule is unique. The cobalt anion is coordinated by two tetrahapto-anthracene ligands. The potassium cation is surrounded by four THF (tetrahydrofuran) molecules occupying four approximate positions of an octahedron. The other two positions are "occupied" by C11, C12, C13 C11A, C12A, C13A of the anthracene ligands at a distance that varies from 3.1 to 3.4 Å. The cobalt-potassium distance is 4.0 Å and the dihedral (fold) angle is 30.8°. Both unique THF molecules were modeled as disordered over two positions (74:26 and 78:22).

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-Ray Crystallographic Laboratory.

Some equations of interest:

$$R_{\text{int}} = \sum |F_{\text{o}}^2 - \langle F_{\text{o}}^2 \rangle| / \sum |F_{\text{o}}^2|$$

$$R_1 = \sum \|F_{\text{o}}\| - \|F_{\text{c}}\| / \sum |F_{\text{o}}|$$

$$wR2 = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \sum [w(F_{\text{o}}^2)^2]]^{1/2}$$

$$\text{where } w = q / [\sigma^2 (F_{\text{o}}^2) + (a*P)^2 + b*P + d + e*\sin(\theta)]$$

$$\text{GooF} = S = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$

Minneapolis, MN 55455

Data collection

A crystal (approximate dimensions 0.50 x 0.25 x 0.18 mm³) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Bruker SMART Platform CCD diffractometer for a data collection at 173(2) K.¹ A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 122 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 10 seconds and a detector distance of 4.98 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.77 Å. Three major sections of frames were collected with 0.30° steps in ω at three different ϕ settings and a detector position of -28° in 2 θ . The intensity data were corrected for absorption and decay (SADABS).² Final cell constants were calculated from the xyz centroids of 2932 strong reflections from the actual data collection after integration (SAINT).³ Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR97⁴ and refined using SHELXL-97.⁵ The space group $P2_1/n$ was determined based on systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. The butadiene ligand hydrogen atoms were found from the difference map and refined with individual isotropic displacement parameters. All remaining hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0357$ and $wR2 = 0.0816$ (F^2 , all data).

Structure description

The structure is the one suggested. All atoms lie on general positions. The butadiene ligands occupy the axial positions of the posstium 18-crown-6 cations, thus forming one dimensional chains (see diagram). The angle between the planes of the butadiene ligands is 14.23(18) degrees. The twist angle of 62.1 degrees means that the geometry is closer to tetrahedral than to square planar.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-Ray Crystallographic Laboratory.

Some equations of interest:

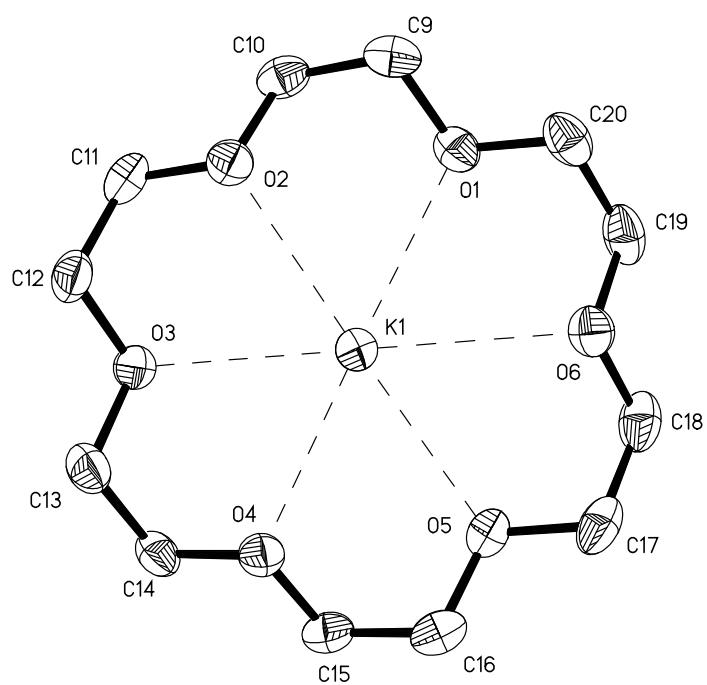

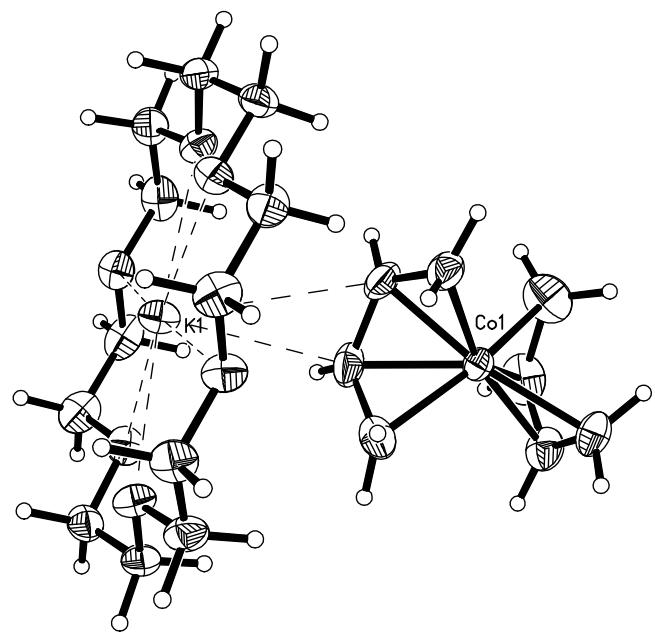

$$R_{\text{int}} = \sum |F_{\text{o}}^2 - \langle F_{\text{o}}^2 \rangle| / \sum |F_{\text{o}}^2|$$

$$R_1 = \sum |F_{\text{o}}| - |F_{\text{c}}| / \sum |F_{\text{o}}|$$

$$wR2 = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \sum [w(F_{\text{o}}^2)^2]]^{1/2}$$

where $w = q / [\sigma^2 (F_{\text{o}}^2) + (a*P)^2 + b*P + d + e*\sin(\theta)]$

$$\text{GooF} = S = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$

Data collection

A crystal ($0.36 \times 0.36 \times 0.32 \text{ mm}^3$) was placed onto the tip of a 0.1 mm diameter glass capillary tube or fiber and mounted on a Siemens SMART CCD Platform diffractometer for a data collection at $223(2) \text{ K}$.¹ The temperature is approximately 20 degrees above that where a phase change occurs, which transforms the crystal from an orthorhombic to a monoclinic setting, the latter which is a non-merohedral twin (180 degree rotation about [1 0 0]). The twinned phase will be examined in a later study. A preliminary set of cell constants and an orientation matrix were calculated from reflections harvested from three orthogonal wedges of reciprocal space. The full data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 10 seconds and a detector distance of 4.92 cm. A randomly oriented region of reciprocal space was surveyed: four major sections of frames were collected with 0.30° steps in ω at four different ϕ settings and a detector position of -28° in 2θ . The intensity data were corrected for absorption.² Final cell constants were calculated from the xyz centroids of 3142 strong reflections from the actual data collection after integration.³ See Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SHELXS-97⁴ and refined using SHELXL-97.⁵ The space group *Pnma* was determined based on systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0242$ ($F^2, I > 2\sigma(I)$) and $wR2 = 0.0555$ (F^2 , all data).

Structure description

The structure is the one suggested. The potassium cation is caged by close contacts to 10 fluorine atoms in a pseudo bicapped octagonal antiprismatic geometry (see diagram). A crystallographic mirror plane coincides with atoms K1, Co1, P2, F4, P3, and F6; thus, one half of the molecule is unique. Atoms of one PF₃ ligand (P3, F6, F7, F8) are disordered slightly over the mirror plane (50:50) and are modeled as such.

Unless noted otherwise all structural diagrams containing thermal displacement ellipsoids are drawn at the 50 % probability level.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-Ray Crystallographic Laboratory.

Some equations of interest:

$$R_{\text{int}} = \sum |F_o^2 - \langle F_o^2 \rangle| / \sum |F_o^2|$$

$$R1 = \sum \|F_o\| - \|F_c\| / \sum |F_o|$$

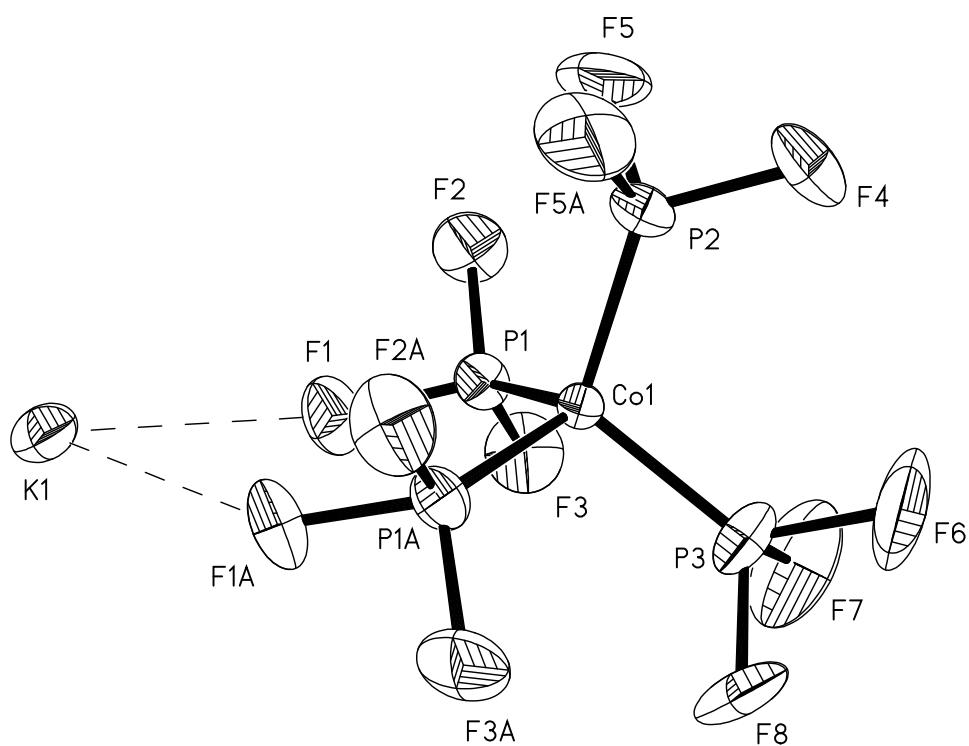

$$wR2 = [\sum [w(F_o^2 - F_c^2)^2] / \sum [w(F_o^2)^2]]^{1/2}$$

where $w = 1 / [\sigma^2(F_o^2) + (aP)^2 + bP]$ and

$$P = 1/3 \max(0, F_o^2) + 2/3 F_c^2$$

$$\text{GOF} = S = [\sum [w(F_o^2 - F_c^2)^2] / (m-n)]^{1/2}$$

where m = number of reflections and n = number of parameters

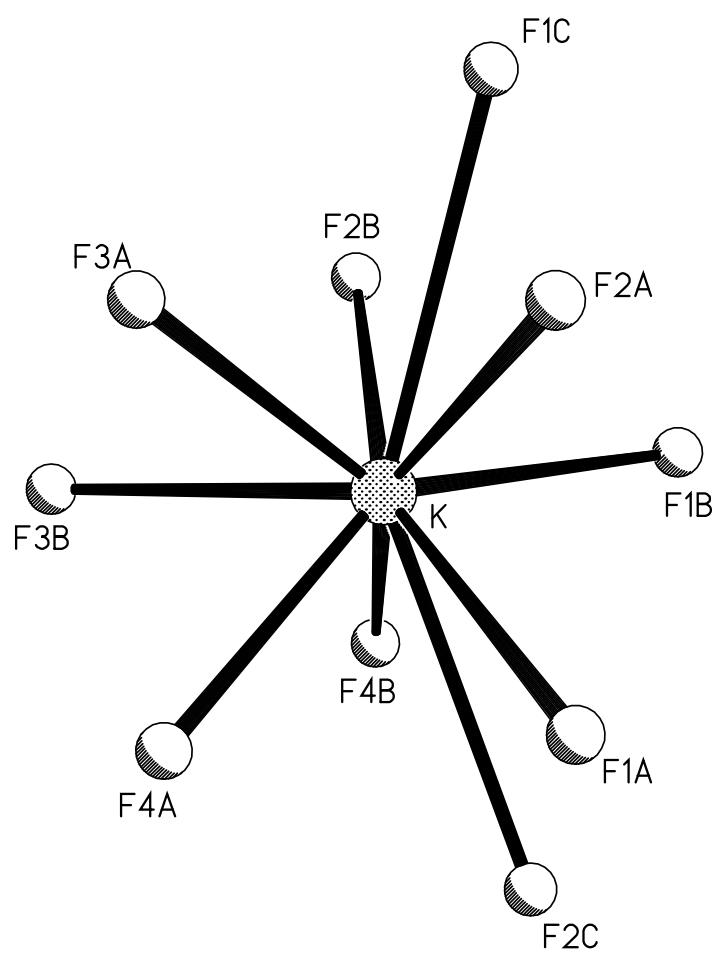

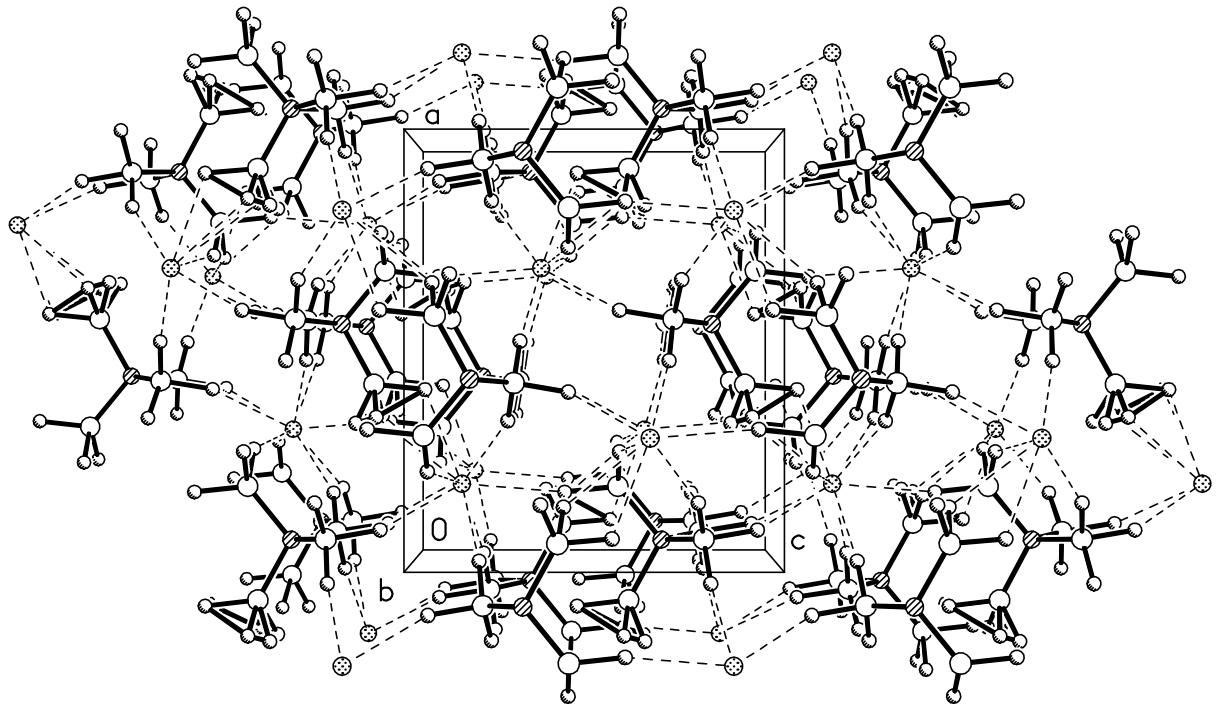

Table 1. Crystal data and structure refinement for 05247.

Identification code	05247		
Empirical formula	Co F12 K P4		
Formula weight	449.91		
Temperature	223(2) K		
Wavelength	0.71073 Å		
Crystal system	Orthorhombic		
Space group	<i>Pnma</i>		
Unit cell dimensions	<i>a</i> = 12.6253(10) Å	α = 90°	
	<i>b</i> = 8.5070(7) Å	β = 90°	
	<i>c</i> = 10.8490(9) Å	γ = 90°	
Volume	1165.22(16) Å ³		
<i>Z</i>	4		
Density (calculated)	2.565 Mg/m ³		
Absorption coefficient	2.512 mm ⁻¹		
<i>F</i> (000)	856		
Crystal color, morphology	colorless, block		
Crystal size	0.36 x 0.36 x 0.32 mm ³		
Theta range for data collection	2.48 to 27.52°		
Index ranges	-16 ≤ <i>h</i> ≤ 16, -11 ≤ <i>k</i> ≤ 11, -13 ≤ <i>l</i> ≤ 14		
Reflections collected	13136		
Independent reflections	1428 [<i>R</i> (int) = 0.0221]		
Observed reflections	1336		
Completeness to theta = 27.52°	99.9%		
Absorption correction	Multi-scan		
Max. and min. transmission	0.4478 and 0.4161		
Refinement method	Full-matrix least-squares on <i>F</i> ²		
Data / restraints / parameters	1428 / 3 / 106		
Goodness-of-fit on <i>F</i> ²	1.088		
Final <i>R</i> indices [<i>I</i> >2sigma(<i>I</i>)]	<i>R</i> 1 = 0.0242, <i>wR</i> 2 = 0.0543		
<i>R</i> indices (all data)	<i>R</i> 1 = 0.0268, <i>wR</i> 2 = 0.0555		
Largest diff. peak and hole	0.518 and -0.391 e.Å ⁻³		

Table 2. Atomic coordinates ($x \times 10^4$) and equivalent isotropic displacement parameters ($\text{\AA}^2 \times 10^3$) for 05247. U_{eq} is defined as one third of the trace of the orthogonalized U_{ij} tensor.

CRYSTAL STRUCTURE REPORT

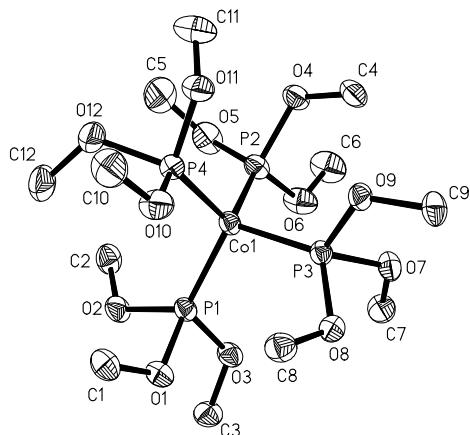

or

Report prepared for:
W. Brennessel, Prof. J. Ellis

May 10, 2001

William W. Brennessel
X-Ray Crystallographic Laboratory
Department of Chemistry
University of Minnesota
207 Pleasant St. S.E.
Minneapolis, MN 55455

Data collection

A crystal (approximate dimensions $0.32 \times 0.27 \times 0.18 \text{ mm}^3$) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Bruker SMART Platform CCD diffractometer for a data collection at 173(2) K. A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 326 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 10 seconds and a detector distance of 4.897 cm. A randomly oriented region of reciprocal space was surveyed to the extent of 1.5 hemispheres and to a resolution of 0.84 Å. Three major sections of frames were collected with 0.30° steps in ω at 3 different ϕ settings and a detector position of -28° in 2θ . The intensity data were corrected for absorption and decay (SADABS).¹ Final cell constants were calculated from the xyz centroids of 3306 strong reflections from the actual data collection after integration (SAINT 6.01, 1999).² Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR³ and refined using SHELXL-97.⁴ The space group P2(1)/c was determined based on systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. All hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R_1 = 0.0368$ and $wR_2 = 0.0991$ (F^2 , all data).

Structure description

The structure is the one suggested. It should be noted that it is a polymorph of an earlier structure.⁵ One methyl group is rotationally disordered.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, 160 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using SGI INDY R4400-SC or Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-Ray Crystallographic Laboratory.

Table 1. Crystal data and structure refinement for 01152.

Identification code	01152	
Empirical formula	C30 H72 Co K N2 O18 P4	
Formula weight	970.81	
Temperature	173(2) K	
Wavelength	0.71073 Å	
Crystal system	Monoclinic	
Space group	P2(1)/c	
Unit cell dimensions	a = 10.6444(9) Å	α= 90°.
	b = 20.543(2) Å	β= 98.218(2)°.
	c = 21.227(2) Å	γ = 90°.
Volume	4593.8(7) Å ³	
Z	4	
Density (calculated)	1.404 Mg/m ³	
Absorption coefficient	0.672 mm ⁻¹	
F(000)	2064	
Crystal habit and color	colorless, block	
Crystal size	0.32 x 0.27 x 0.18 mm ³	
Theta range for data collection	1.39 to 27.52°.	
Index ranges	-13= h = 13, -26= k = 26, -25= l = 27	
Reflections collected	36689	
Independent reflections	10513 [R(int) = 0.0563]	
Observed Reflections	8184	
Completeness to theta = 27.52°	99.3 %	
Absorption correction	Multi-scan	
Max. and min. transmission	1.000000 and 0.823446	
Refinement method	Full-matrix least-squares on F ²	
Data / restraints / parameters	10513 / 0 / 517	
Goodness-of-fit on F ²	0.978	
Final R indices [I>2sigma(I)]	R1 = 0.0368, wR2 = 0.0939	
R indices (all data)	R1 = 0.0497, wR2 = 0.0991	
Largest diff. peak and hole	0.668 and -0.362 e.Å ⁻³	

Table 2. Atomic coordinates ($x \times 10^4$) and equivalent isotropic displacement parameters ($\text{\AA}^2 \times 10^3$) for 01152. U_{eq} is defined as one third of the trace of the orthogonalized U_{ij} tensor.

Minneapolis, MN 55455

Data collection

A crystal ($0.32 \times 0.24 \times 0.20 \text{ mm}^3$) was placed onto the tip of a 0.1 mm diameter glass capillary tube or fiber and mounted on a Bruker SMART CCD Platform diffractometer for a data collection at $173(2) \text{ K}$.¹ A preliminary set of cell constants and an orientation matrix were calculated from reflections harvested from three orthogonal wedges of reciprocal space. The full data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 45 seconds and a detector distance of 4.84 cm. A randomly oriented region of reciprocal space was surveyed: three major sections of frames were collected with 0.30° steps in ω at three different ϕ settings and a detector position of -28° in 2θ . The intensity data were corrected for absorption.² Final cell constants were calculated from the xyz centroids of 3895 strong reflections from the actual data collection after integration.³ See Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR97⁴ and refined using SHELXL-97.⁵ The space group $P2_1/c$ was determined based on systematic absences. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. All hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0493$ ($F^2, I > 2\sigma(I)$) and $wR2 = 0.1375$ (F^2 , all data).

Structure description

The structure is the one suggested. The atoms of the anion lie on general positions and are well separated from those of the cation. The cation is located on two different crystallographic inversion centers; thus, one half of each is unique. THF solvent molecules occupy the axial positions of the potassium cations. One is modeled as disordered over two positions (77:23) and the other is modeled as disordered over three positions (44:35:21). The geometry about the cobalt center is nearly tetrahedral (twist angle of $82.42(3)^\circ$).

Unless noted otherwise all structural diagrams containing thermal displacement ellipsoids are drawn at the 50 % probability level.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-Ray Crystallographic Laboratory.

Some equations of interest:

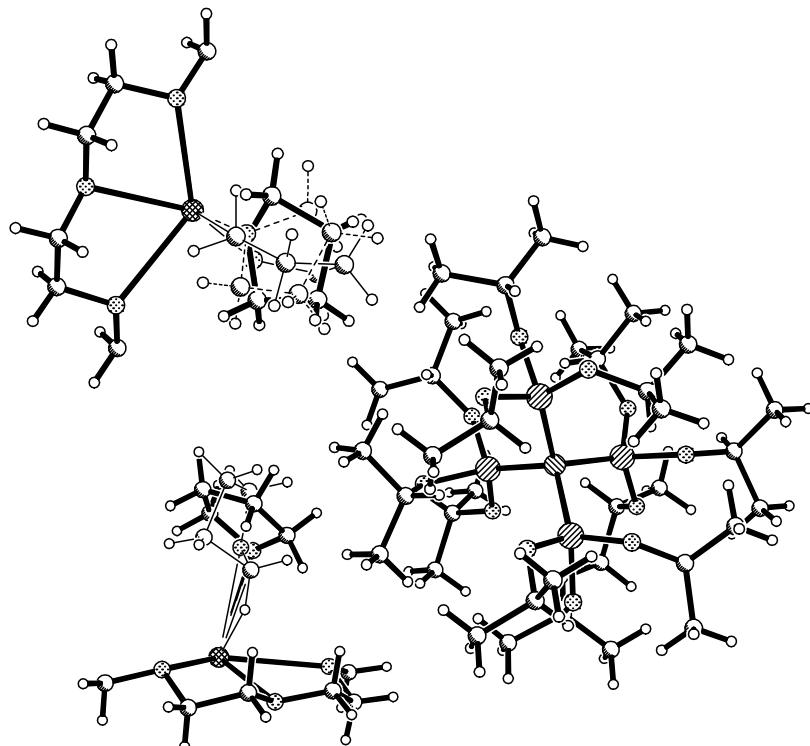

$$R_{\text{int}} = \sum |F_o|^2 - \langle F_o^2 \rangle / \sum |F_o|^2$$

$$R_1 = \sum ||F_o| - |F_c|| / \sum |F_o|$$

$$wR2 = [\sum [w(F_o^2 - F_c^2)^2] / \sum [w(F_o^2)^2]]^{1/2}$$

$$\text{where } w = q / [\sigma^2 (F_o^2) + (a^*P)^2 + b^*P + d + e^*\sin(\theta)]$$

$$\text{GooF} = S = [\sum [w(F_o^2 - F_c^2)^2] / (n-p)]^{1/2}$$

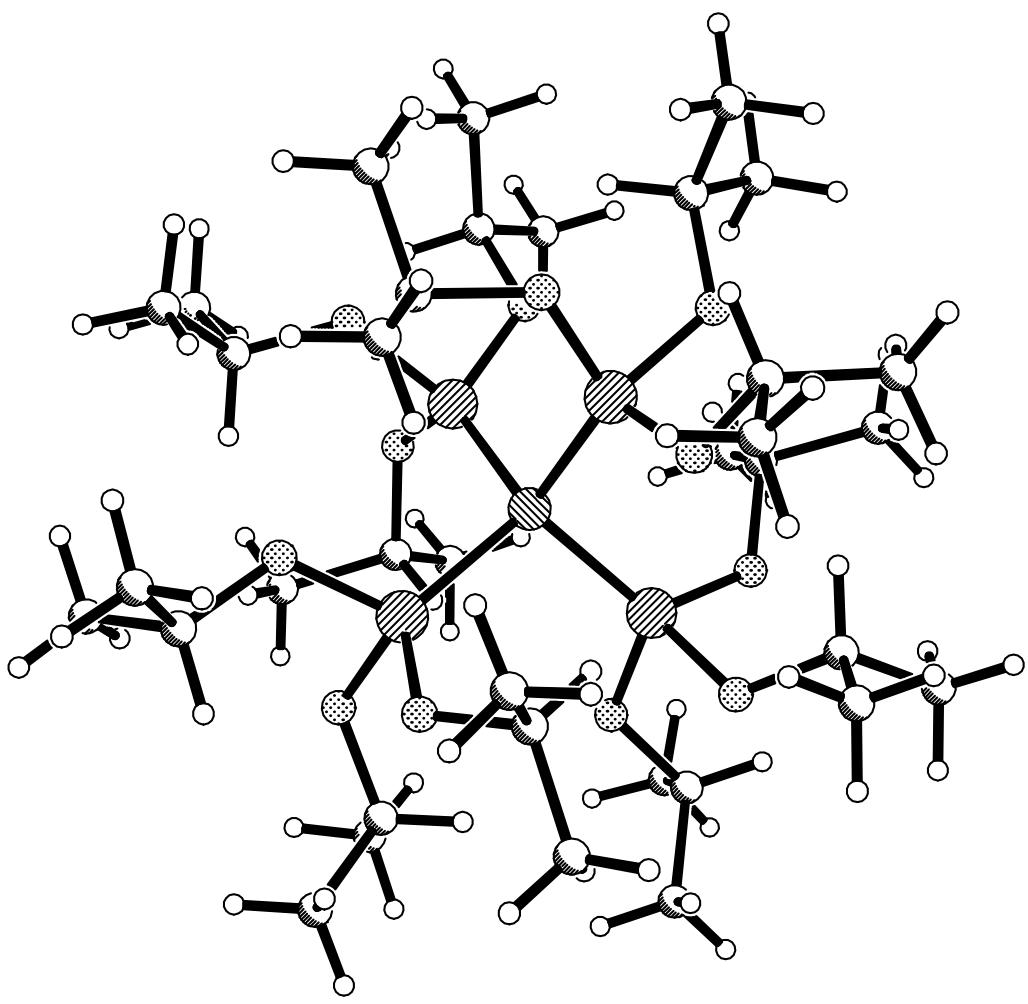

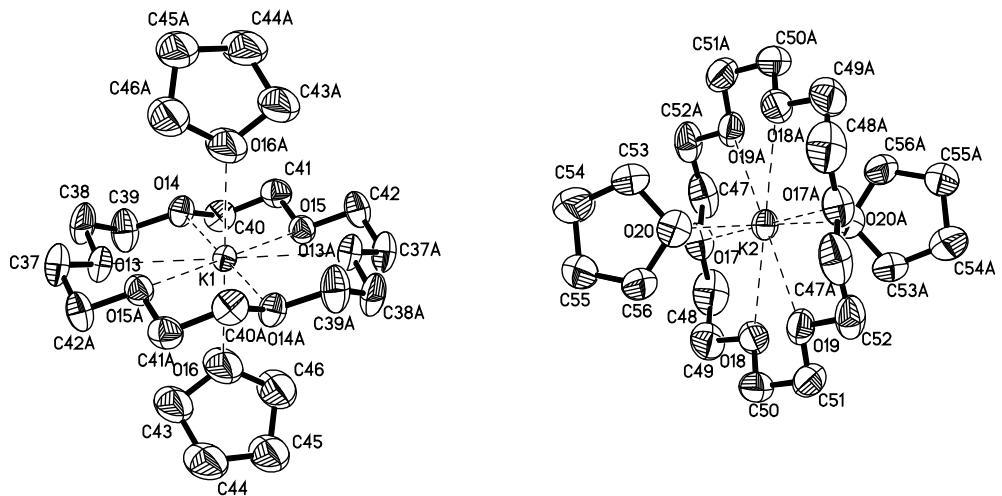

Table 1. Crystal data and structure refinement for 253.

Identification code	04253		
Empirical formula	C56 H124 Co K O20 P4		
Formula weight	1339.46		
Temperature	173(2) K		
Wavelength	0.71073 Å		
Crystal system	Monoclinic		
Space group	<i>P</i> 2 ₁ /c		
Unit cell dimensions	<i>a</i> = 24.2720(17) Å	<i>α</i> = 90°	
	<i>b</i> = 17.8466(12) Å	<i>β</i> = 90.545(1)°	
	<i>c</i> = 17.2666(12) Å	<i>γ</i> = 90°	
Volume	7479.1(9) Å ³		
<i>Z</i>	4		
Density (calculated)	1.190 Mg/m ³		
Absorption coefficient	0.432 mm ⁻¹		
<i>F</i> (000)	2904		
Crystal color, morphology	colorless, block		
Crystal size	0.32 x 0.24 x 0.20 mm ³		
Theta range for data collection	1.42 to 27.53°		
Index ranges	-31 ≤ <i>h</i> ≤ 31, -23 ≤ <i>k</i> ≤ 23, -22 ≤ <i>l</i> ≤ 22		
Reflections collected	66211		
Independent reflections	17158 [<i>R</i> (int) = 0.0660]		
Observed reflections	11159		
Completeness to theta = 27.53°	99.5%		
Absorption correction	Multi-scan		
Max. and min. transmission	0.9186 and 0.8742		
Refinement method	Full-matrix least-squares on <i>F</i> ²		
Data / restraints / parameters	17158 / 76 / 815		
Goodness-of-fit on <i>F</i> ²	1.023		
Final <i>R</i> indices [<i>I</i> >2sigma(<i>I</i>)]	<i>R</i> 1 = 0.0493, <i>wR</i> 2 = 0.1133		
<i>R</i> indices (all data)	<i>R</i> 1 = 0.0920, <i>wR</i> 2 = 0.1375		
Largest diff. peak and hole	0.933 and -0.487 e.Å ⁻³		

Table 2. Atomic coordinates ($x \times 10^4$) and equivalent isotropic displacement parameters ($\text{\AA}^2 \times 10^3$) for 253. U_{eq} is defined as one third of the trace of the orthogonalized U_{ij} tensor.

CRYSTAL STRUCTURE REPORT

Report prepared for:

William Brennessel

April 8, 2004

Ben Kucera

X-Ray Crystallographic Laboratory

Department of Chemistry

University of Minnesota

207 Pleasant St. S.E.

Minneapolis, MN 55455

Data collection

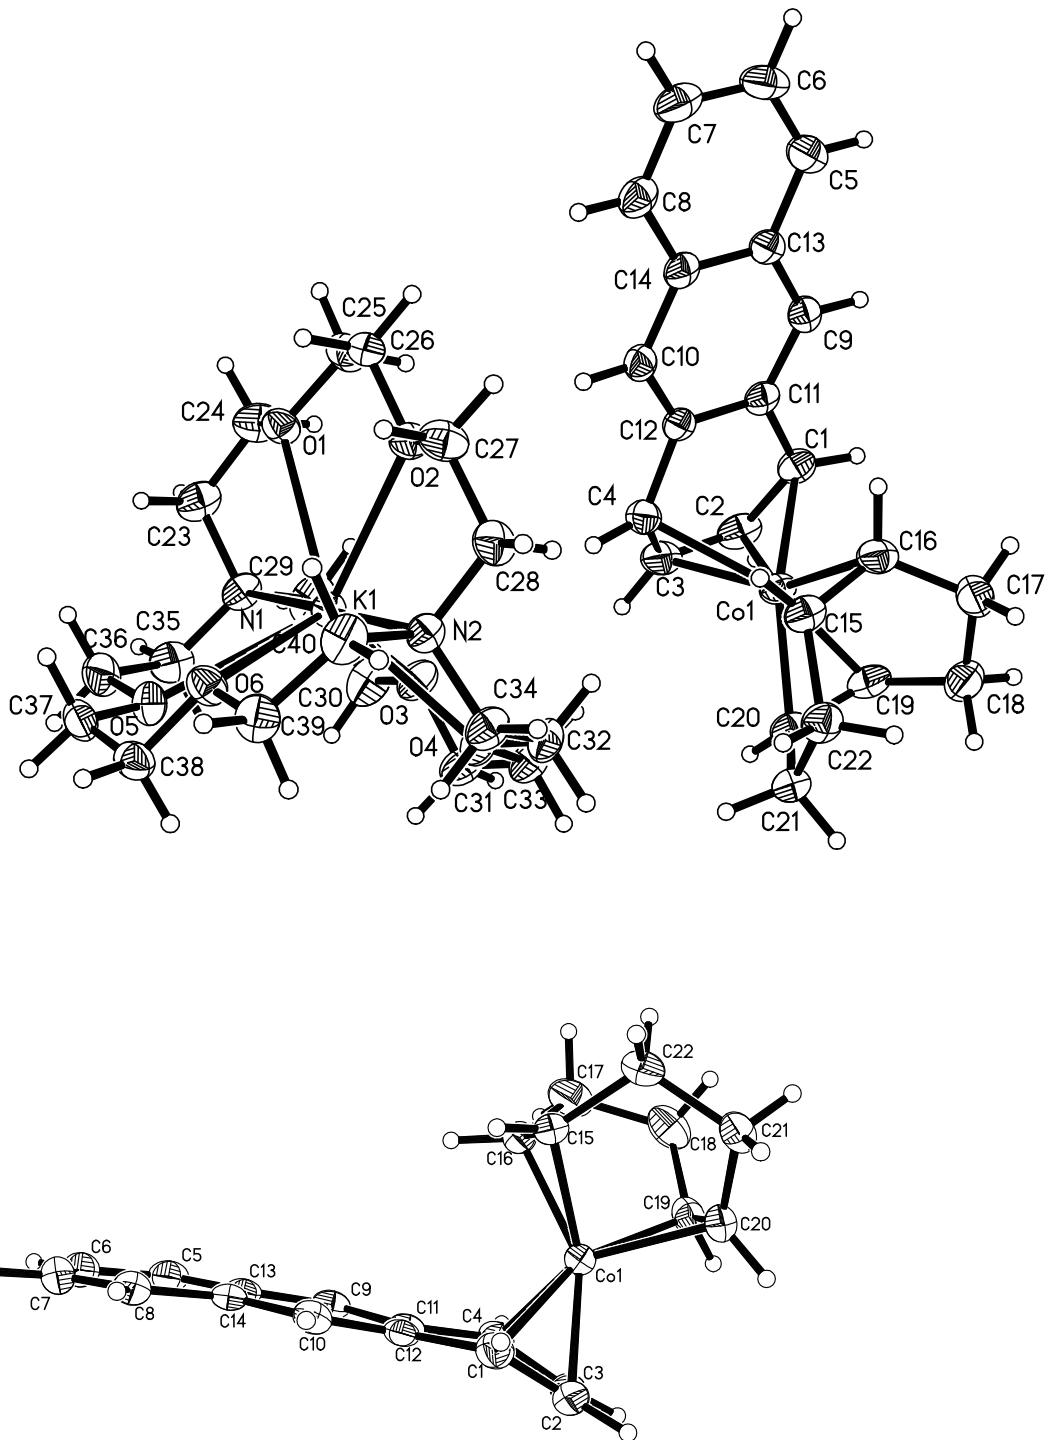

A crystal (approximate dimensions 0.50 x 0.35 x 0.10 mm³) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Bruker SMART Platform CCD diffractometer for a data collection at 173(2) K. A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 48 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 30 seconds and a detector distance of 4.926 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.77 Å. Four major sections of frames were collected with 0.30° steps in ω at four different ϕ settings and a detector position of -28° in 2 θ . The intensity data were corrected for absorption and decay (SADABS).¹ Final cell constants were calculated from the xyz centroids of 3592 strong reflections from the actual data collection after integration (SAINT).² Please refer to Table 1 for additional crystal and refinement information.

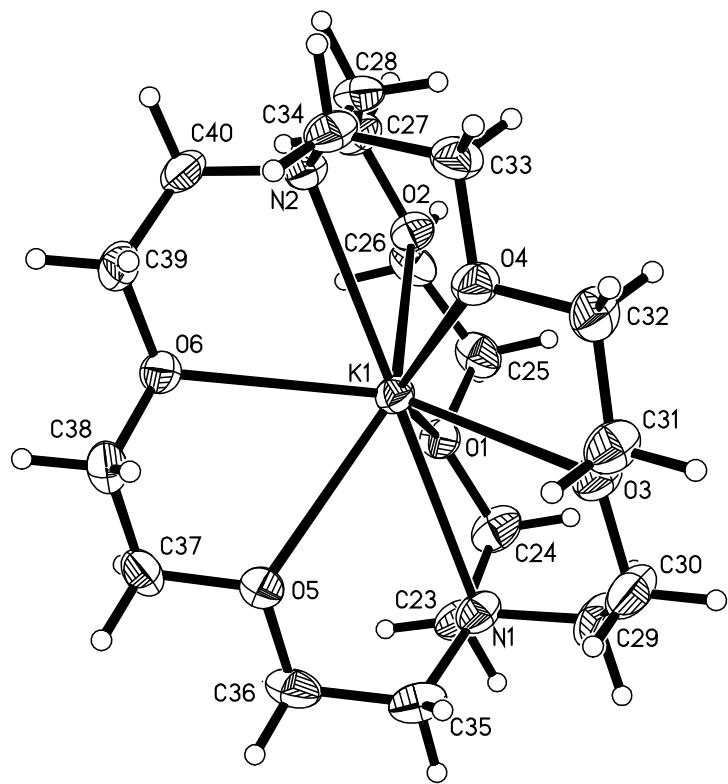

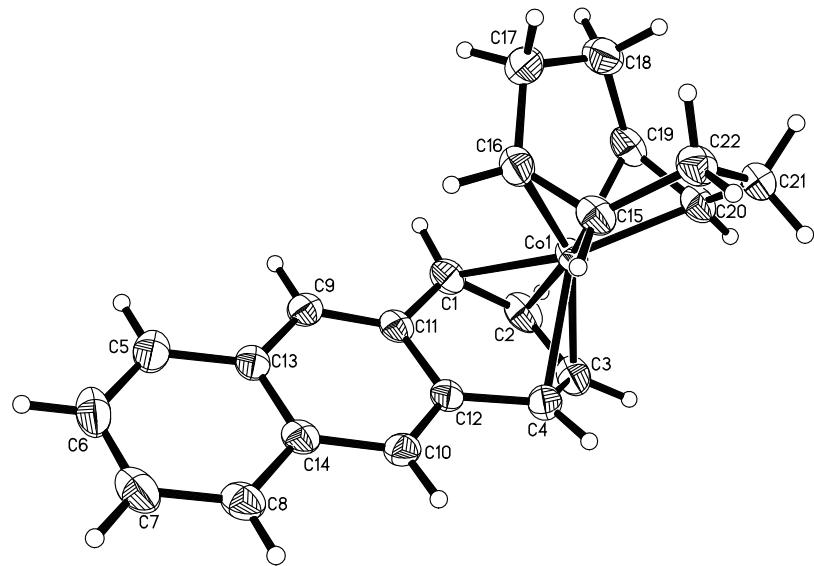

Structure solution and refinement

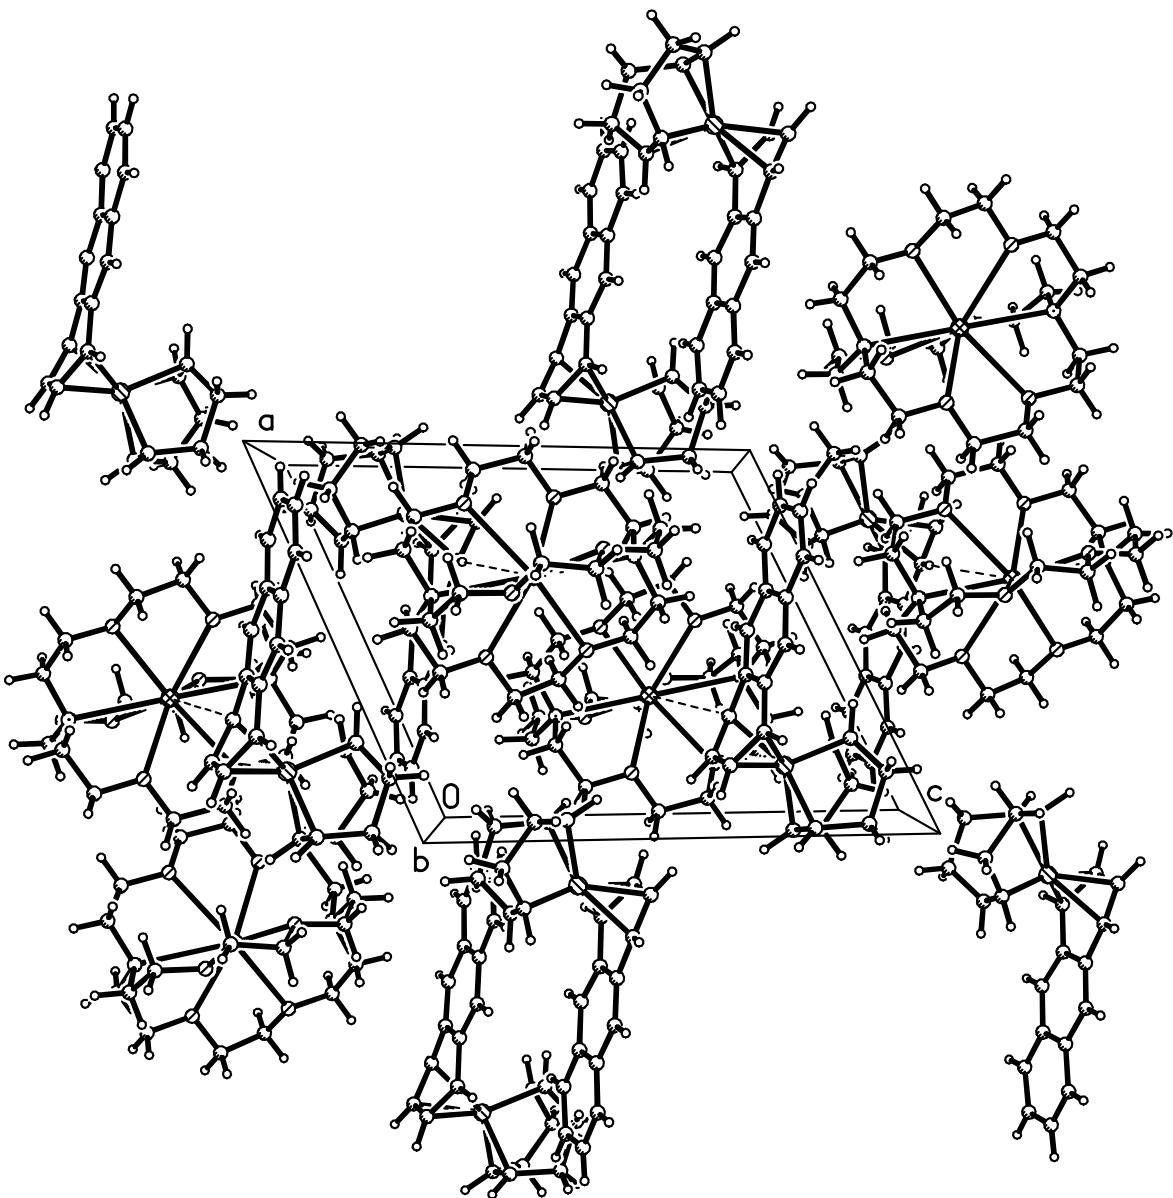

The structure was solved using SHELXS-97³ and refined using SHELXL-97.³ The space group P-1 was determined based on systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. All hydrogen atoms (except those on carbons attached to the Cobalt center) were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The remaining hydrogens were found from the difference map and refined with individual isotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0359$ and $wR2 = 0.0994$ (F^2 , all data).

Structure description

The structure is the one suggested.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, 160 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include Ben Kucera as a coauthor or 2) acknowledge Ben Kucera, Victor G. Young, Jr., and the X-Ray Crystallographic Laboratory.

Some equations of interest:

$$R_{\text{int}} = \sum |F_{\text{o}}^2 - \langle F_{\text{o}}^2 \rangle| / \sum |F_{\text{o}}|^2$$

$$R_1 = \sum |F_{\text{o}}| - |F_{\text{c}}| / \sum |F_{\text{o}}|$$

$$wR2 = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \sum [w(F_{\text{o}}^2)^2]]^{1/2}$$

where $w = q / [\sigma^2 (F_{\text{o}}^2) + (a*P)^2 + b*P + d + e*\sin(\theta)]$

$$\text{GooF} = S = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$

CRYSTAL STRUCTURE REPORT

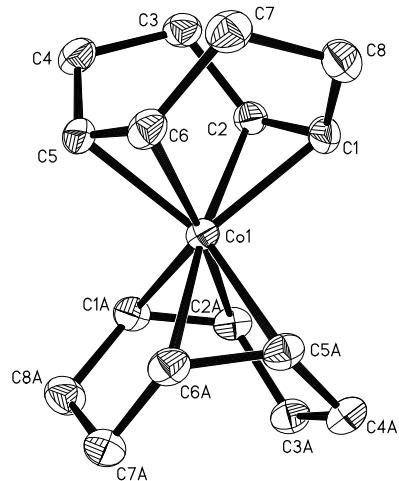

or

Report prepared for:

W. Brennessel, Prof. J. Ellis

April 06, 2004

William W. Brennessel
X-Ray Crystallographic Laboratory
Department of Chemistry
University of Minnesota
207 Pleasant St. S.E.
Minneapolis, MN 55455

Data collection

A crystal (approximate dimensions $0.45 \times 0.24 \times 0.19 \text{ mm}^3$) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Siemens SMART Platform CCD diffractometer for a data collection at 173(2) K. A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 221 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 10 seconds and a detector distance of 4.89 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.77 Å. Three major sections of frames were collected with 0.30° steps in ω at three different ϕ settings and a detector position of -28° in 2θ . The intensity data were corrected for absorption and decay (SADABS).¹ Final cell constants were calculated from the xyz centroids of 3578 strong reflections from the actual data collection after integration (SAINT).² Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR97³ and refined using SHELXL-97.⁴ The space group $Pccn$ was determined based on systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. Hydrogen atoms on the coordinated carbon atoms were found from the difference map and refined with individual isotropic displacement parameters. The remaining hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0424$ and $wR2 = 0.0815$ (F^2 , all data).

Structure description

The structure is the one suggested. The cobalt and potassium atoms are located on different two-fold axes (both parallel to the c axis); thus, one half of each molecule is unique. With a twist angle is 67.3° , the geometry is closer to tetrahedral than square planar.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, 160 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-Ray Crystallographic Laboratory.

Some equations of interest:

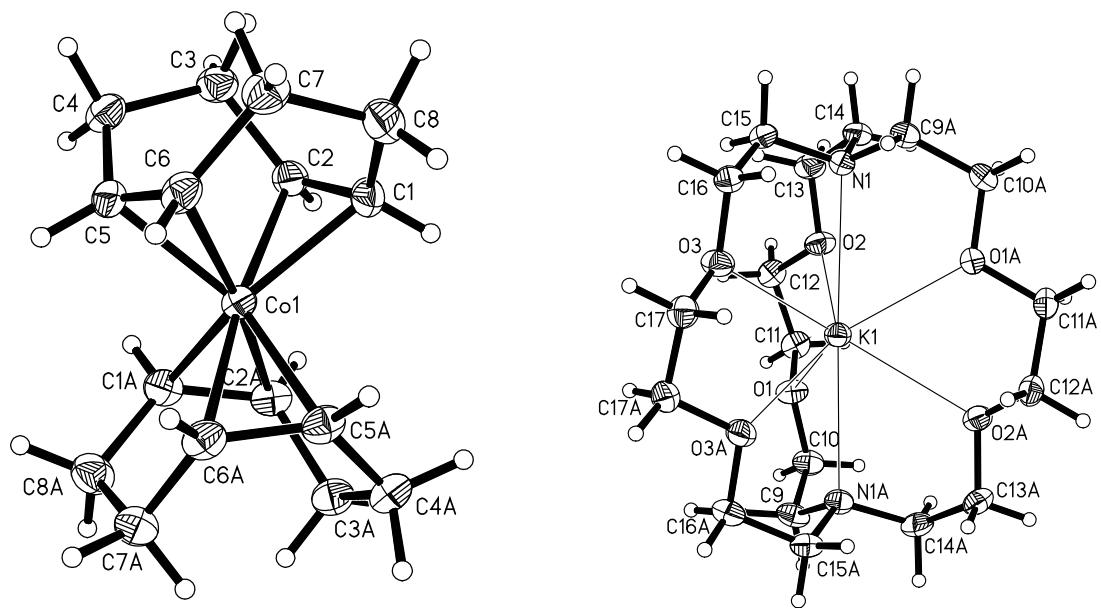

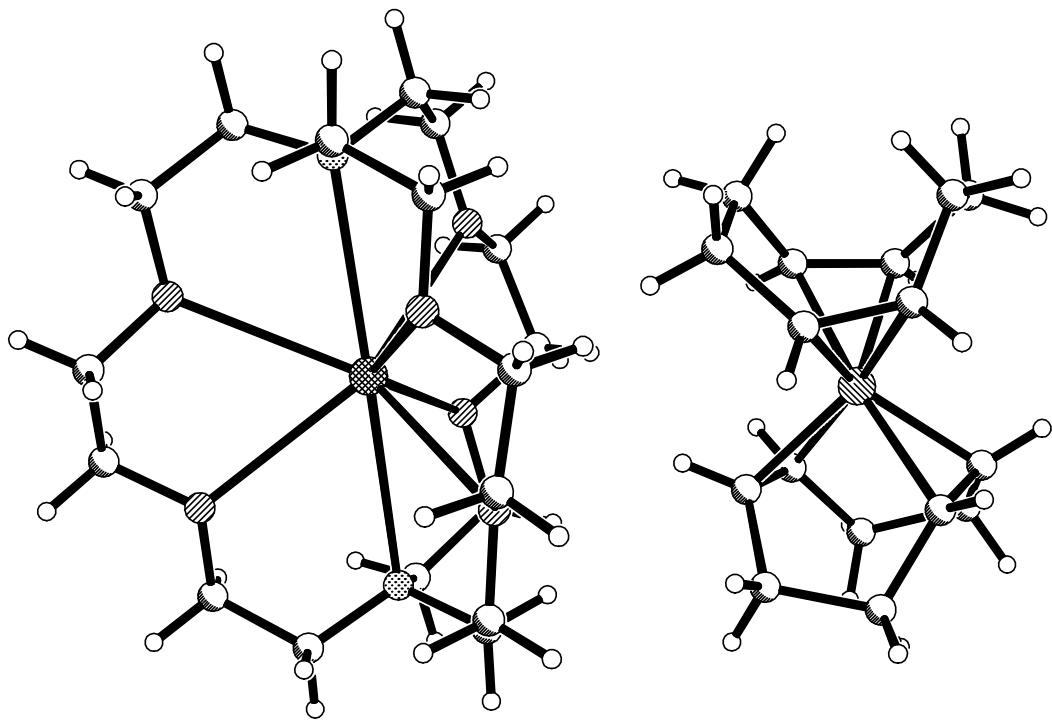

$$R_{\text{int}} = \sum |F_{\text{o}}^2 - \langle F_{\text{o}}^2 \rangle| / \sum |F_{\text{o}}^2|$$

$$R_1 = \sum \|F_{\text{o}}\| - \|F_{\text{c}}\| / \sum |F_{\text{o}}|$$

$$wR2 = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \sum [w(F_{\text{o}}^2)^2]]^{1/2}$$

where $w = q / [\sigma^2 (F_{\text{o}}^2) + (a^*P)^2 + b^*P + d + e^*\sin(\theta)]$

$$\text{GooF} = S = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$

CRYSTAL STRUCTURE REPORT

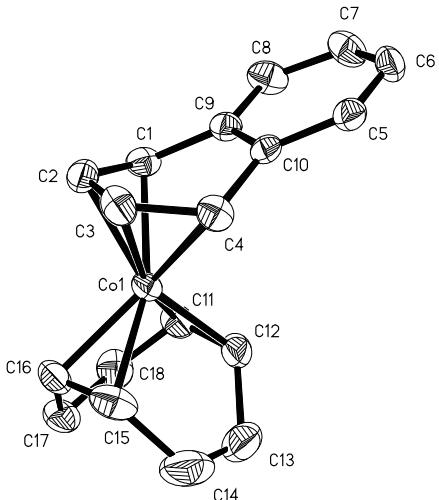

or

Report prepared for:

W. Brennessel, Prof. J. Ellis

December 12, 2004

William W. Brennessel

X-Ray Crystallographic Laboratory

Department of Chemistry

University of Minnesota

207 Pleasant St. S.E.

Minneapolis, MN 55455

Data collection

A crystal (approximate dimensions 0.50 x 0.20 x 0.08 mm³) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Bruker SMART Platform CCD diffractometer for a data collection at 173(2) K.¹ A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 94 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 20 seconds and a detector distance of 4.81 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.77 Å. Four major sections of frames were collected with 0.30° steps in ω at four different ϕ settings and a detector position of -28° in 2 θ . The intensity data were corrected for absorption and decay (SADABS).² Final cell constants were calculated from the xyz centroids of 3487 strong reflections from the actual data collection after integration (SAINT).³ Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR97⁴ and refined using SHELXL-97.⁵ The space group *P*-1 was determined based on the lack of systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. Hydrogen atoms on metal-coordinated carbon atoms were found from the difference map and refined with individual isotropic displacement parameters. The remaining hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R_1 = 0.0491$ and $wR_2 = 0.1301$ (F^2 , all data).

Structure description

The structure is the one suggested. There are two independent cation-anion pairs in the asymmetric unit with all atoms on general positions. All cation-anion pairs are well separated from one another. One of the anions (Co1) has close contact to its potassium cation (K1) through the 1,5-COD ligand; the other (Co2) has close contact to its potassium cation (K2) through the naphthalene ligand. The initial synthesis involved 1,3-COD, which apparently isomerized to 1,5-COD. The fold (dihedral) angles on the naphthalene ligands are 32.4(2)° and 27.8(2)° for naphthalene ligands bound to Co1 and Co2, respectively. The respective twist angles are 69.6° and 69.1°: the overall geometry is closer to tetrahedral than to square planar.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-

Ray Crystallographic Laboratory.

Some equations of interest:

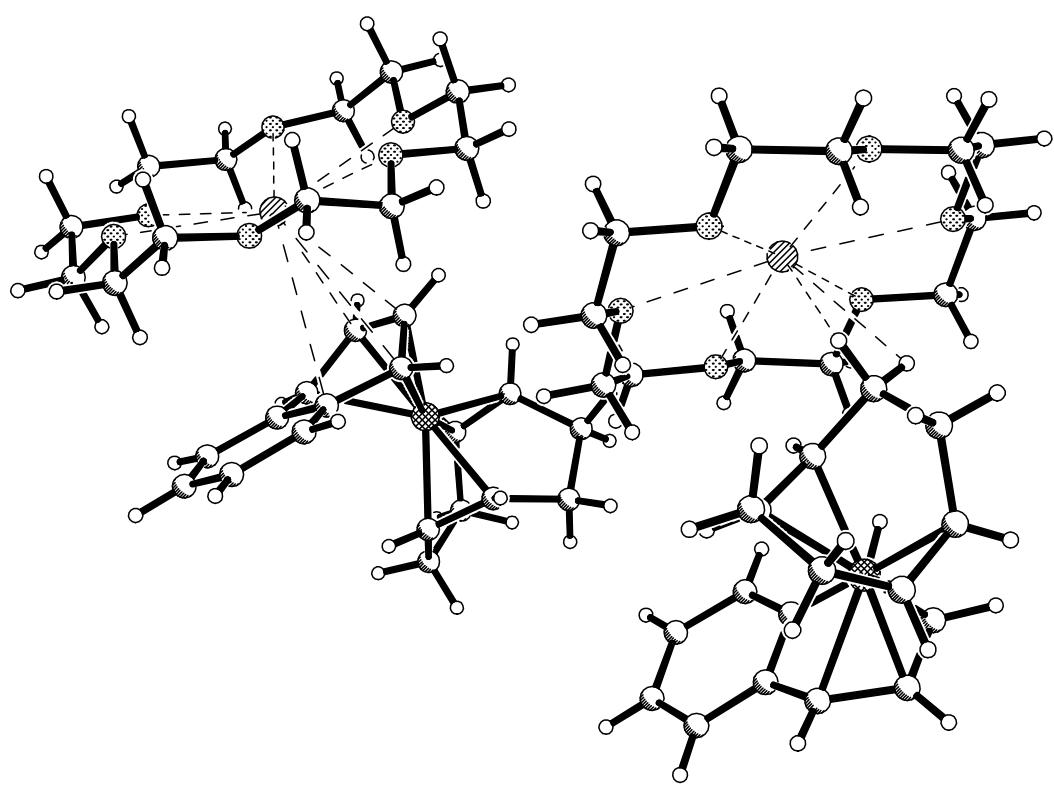

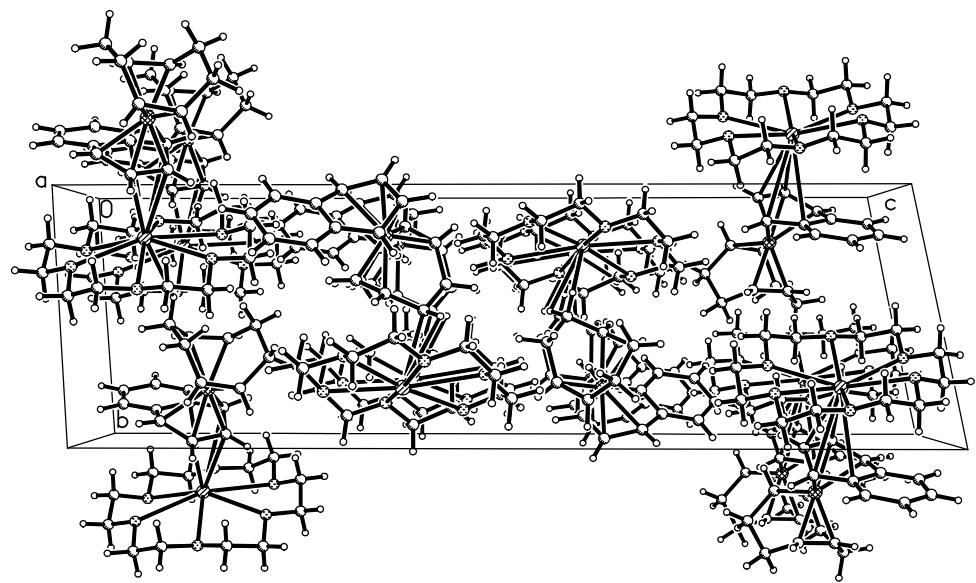

$$R_{\text{int}} = \sum |F_{\text{o}}^2 - \langle F_{\text{o}}^2 \rangle| / \sum |F_{\text{o}}^2|$$

$$R_1 = \sum |F_{\text{o}}| - |F_{\text{c}}| / \sum |F_{\text{o}}|$$

$$wR2 = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \sum [w(F_{\text{o}}^2)^2]]^{1/2}$$

where $w = q / [\sigma^2(F_{\text{o}}^2) + (a*P)^2 + b*P + d + e*\sin(\theta)]$

$$\text{GooF} = S = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$

CRYSTAL STRUCTURE REPORT

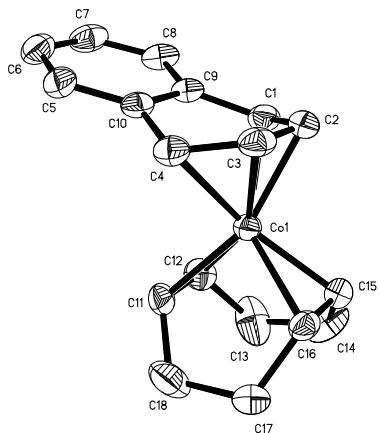

or

Report prepared for:

W. Brennessel, Prof. J. Ellis

June 03, 2005

William W. Brennessel
X-Ray Crystallographic Laboratory
Department of Chemistry
University of Minnesota
207 Pleasant St. S.E.
Minneapolis, MN 55455

Data collection

A crystal (approximate dimensions $0.32 \times 0.30 \times 0.24 \text{ mm}^3$) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Siemens SMART Platform CCD diffractometer for a data collection at $173(2) \text{ K}$.¹ A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 184 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 10 seconds and a detector distance of 4.92 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.77 \AA . Four major sections of frames were collected with 0.30° steps in ω at four different ϕ settings and a detector position of -28° in 2θ . The intensity data were corrected for absorption and decay (SADABS).² Final cell constants were calculated from the xyz centroids of 3851 strong reflections from the actual data collection after integration (SAINT).³ Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR97⁴ and refined using SHELXL-97.⁵ The space group $P-1$ was determined based on the lack of systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. Hydrogen atoms on carbon atoms attached to the cobalt center were found from the difference map and refined with individual isotropic displacement parameters. The remaining hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0369$ and $wR2 = 0.0887$ (F^2 , all data).

Structure description

The structure is the one suggested. It is a double salt of naphthalenecyclooctadienecobaltate and cyclopentadienide, in a ratio of one to one half. The Cp anion is sandwiched between two $\text{K}(18\text{-crown-6})$ cations and lies on a crystallographic inversion center; thus, one half of this complex cation is unique and the disorder of the Cp anion is 50:50. The second cation, $\text{K}(18\text{-crown-6})(\text{THF})_2^+$, also lies on a crystallographic inversion center, coincident with the potassium atom; thus, one half of this cation is unique. The atoms of the cobalt anion all lie on general positions; the twist angle is 81.4° (almost tetrahedral) and the dihedral (fold) angle is $27.4(1)^\circ$.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-Ray Crystallographic Laboratory.

Some equations of interest:

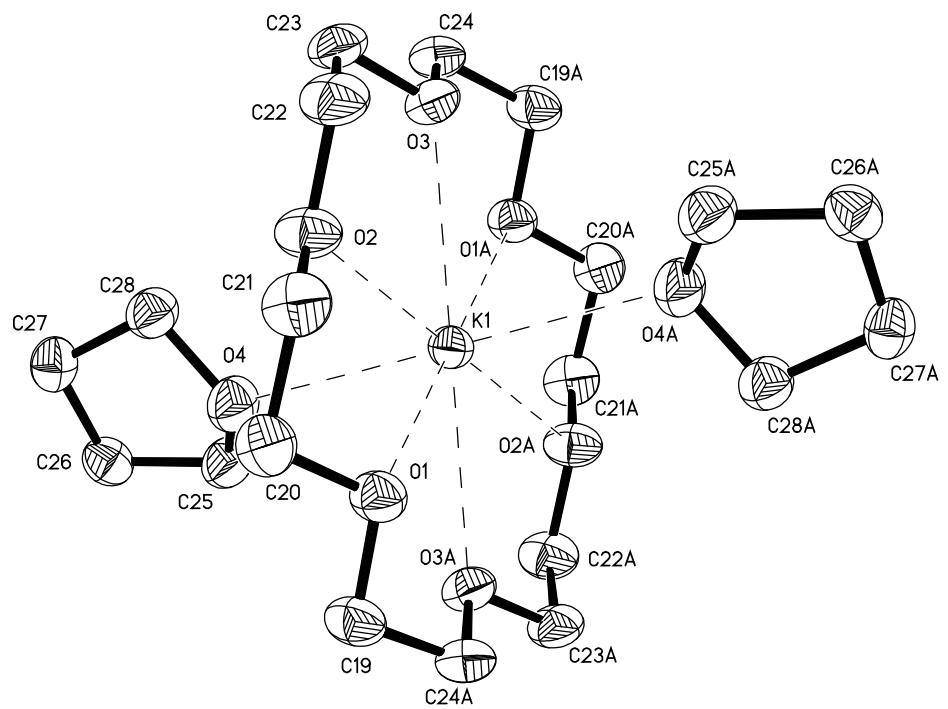

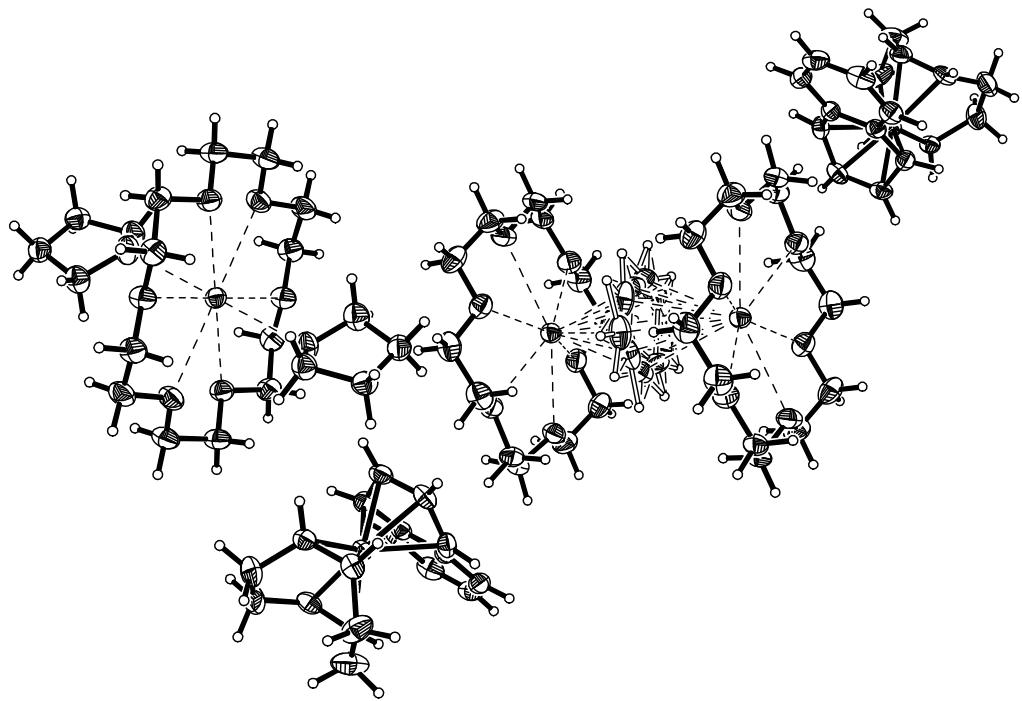

$$R_{\text{int}} = \sum |F_{\text{o}}^2 - \langle F_{\text{o}}^2 \rangle| / \sum |F_{\text{o}}^2|$$

$$R_1 = \sum |F_{\text{o}}| - |F_{\text{c}}| / \sum |F_{\text{o}}|$$

$$wR2 = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \sum [w(F_{\text{o}}^2)^2]]^{1/2}$$

where $w = q / [\sigma^2 (F_{\text{o}}^2) + (a*P)^2 + b*P + d + e*\sin(\theta)]$

$$\text{GooF} = S = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$

CRYSTAL STRUCTURE REPORT

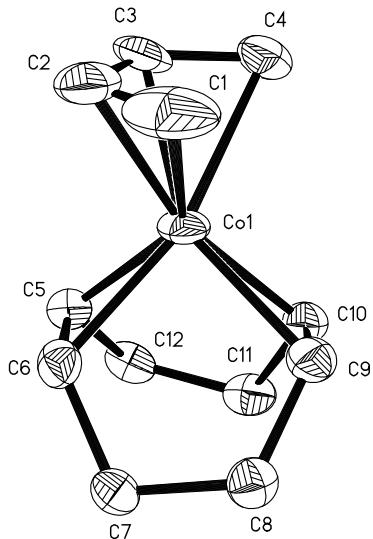

or

Report prepared for:

W. Brennessel, Prof. J. Ellis

October 30, 2005

William W. Brennessel
X-Ray Crystallographic Laboratory
Department of Chemistry
University of Minnesota
207 Pleasant St. S.E.
Minneapolis, MN 55455

Data collection

A crystal ($0.32 \times 0.30 \times 0.24 \text{ mm}^3$) was placed onto the tip of a 0.1 mm diameter glass capillary tube or fiber and mounted on a Bruker SMART CCD Platform diffractometer for a data collection at 123(2) K.¹ The lower temperature was applied after a previously applied crystal turned to powder after an hour at 173(2) K (this may have been specific to flaws in that one crystal). A preliminary set of cell constants and an orientation matrix were calculated from reflections harvested from three orthogonal wedges of reciprocal space. The full data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 15 seconds and a detector distance of 4.98 cm. A randomly oriented region of reciprocal space was surveyed: three major sections of frames were collected with 0.30° steps in ω at three different ϕ settings and a detector position of -28° in 2θ . The intensity data were corrected for absorption.² Final cell constants were calculated from the xyz centroids of 3182 strong reflections from the actual data collection after integration.³ See Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR97⁴ and refined using SHELXL-97.⁵ The space group $P-1$ was determined based on intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. All hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0401 (F^2, I > 2\sigma(I))$ and $wR2 = 0.1016 (F^2, \text{all data})$.

Structure description

The structure is the one suggested. The cation and anion form discrete units with all atoms on general positions. The butadiene ligand occupies an axial position of the potassium atom. It is also disordered and was modeled over two positions (51:49). The other axial position of the potassium atom is occupied by the symmetry equivalent of the C11 methylene group.

Unless noted otherwise all structural diagrams containing thermal displacement ellipsoids are drawn at the 50 % probability level.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-Ray Crystallographic Laboratory.

Some equations of interest:

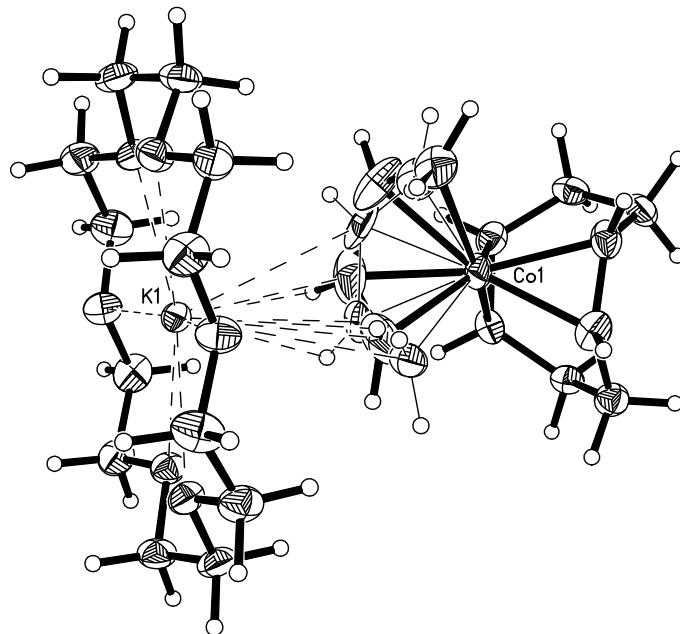

$$R_{\text{int}} = \sum |F_o^2 - \langle F_o^2 \rangle| / \sum |F_o^2|$$

$$R_1 = \sum |F_o| - |F_c| / \sum |F_o|$$

$$wR2 = [\sum [w(F_o^2 - F_c^2)^2] / \sum [w(F_o^2)^2]]^{1/2}$$

$$\text{where } w = q / [\sigma^2 (F_o^2) + (a*P)^2 + b*P + d + e*\sin(\theta)]$$

$$\text{GooF} = S = [\sum [w(F_o^2 - F_c^2)^2] / (n-p)]^{1/2}$$

CRYSTAL STRUCTURE REPORT

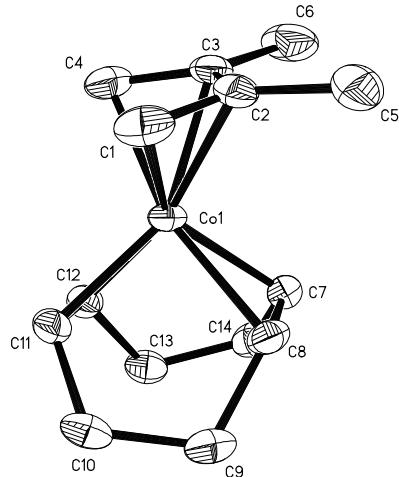

or

Report prepared for:

W. Brennessel, Prof. J. Ellis

November 09, 2004

William W. Brennessel
X-Ray Crystallographic Laboratory
Department of Chemistry
University of Minnesota
207 Pleasant St. S.E.
Minneapolis, MN 55455

Data collection

A crystal (approximate dimensions 0.32 x 0.14 x 0.10 mm³) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Siemens SMART Platform CCD diffractometer for a data collection at 173(2) K.¹ A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 65 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 25 seconds and a detector distance of 4.91 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.77 Å. Four major sections of frames were collected with 0.30° steps in ω at four different ϕ settings and a detector position of -28° in 2 θ . The intensity data were corrected for absorption and decay (SADABS).² Final cell constants were calculated from the xyz centroids of 3701 strong reflections from the actual data collection after integration (SAINT).³ Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR97⁴ and refined using SHELXL-97.⁵ The space group *P*-1 was determined based on the lack of systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. All hydrogen atoms of the cation and the methyl hydrogen atoms of the anion were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. All remaining hydrogen atoms were found from the difference Fourier map and refined with relative isotropic displacement parameters. One relatively large peak of electron density (1.4 electrons per Å³) lies within the van der Waals surface of a CH₂ group of the 18-crown-6 complexant, and therefore, could not be modeled. The final full matrix least squares refinement converged to *R*1 = 0.0398 and *wR*2 = 0.1024 (*F*², all data).

Structure description

The structure is the one suggested. All atoms lie on general positions. One C3 and C4 of the butadiene ligand and one CH₂ group (C9) of the cyclooctadiene ligand on the anion are weakly coordinated to neighboring potassium cations, thereby completing the potassium coordination spheres. The net result is a pseudo polymeric structure in one dimension along the *b* axis. The cell constants of this structure are extremely close to those of [K(18-crown-6)][Co(COD)₂] (local code 04077).

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-

Ray Crystallographic Laboratory.

Some equations of interest:

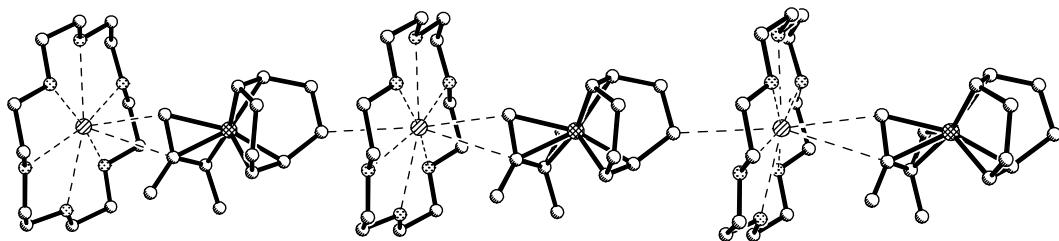

$$R_{\text{int}} = \sum |F_{\text{o}}^2 - \langle F_{\text{o}}^2 \rangle| / \sum |F_{\text{o}}^2|$$

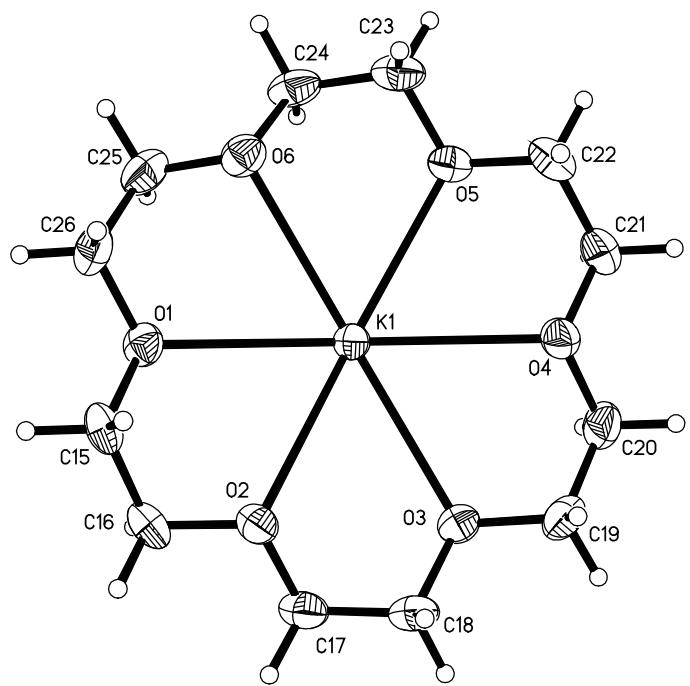

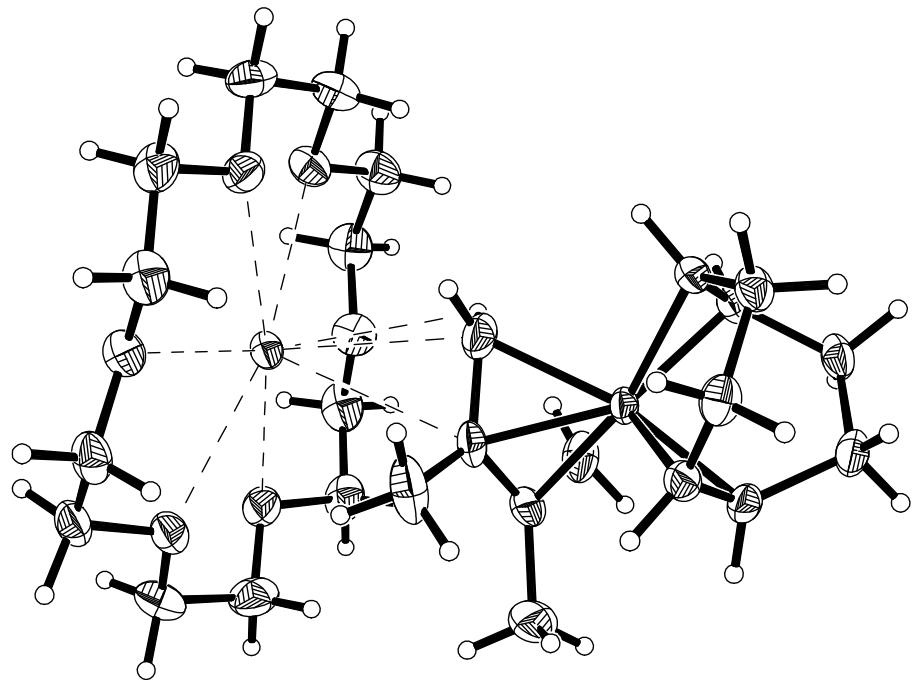

$$R_1 = \sum |F_{\text{o}}| - |F_{\text{c}}| / \sum |F_{\text{o}}|$$

$$wR2 = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \sum [w(F_{\text{o}}^2)^2]]^{1/2}$$

where $w = q / [\sigma^2(F_{\text{o}}^2) + (a^*P)^2 + b^*P + d + e^*\sin(\theta)]$

$$\text{GooF} = S = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$

207 Pleasant St. S.E.
Minneapolis, MN 55455

Data collection

A crystal (approximate dimensions $0.45 \times 0.24 \times 0.12 \text{ mm}^3$) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Siemens SMART Platform CCD diffractometer for a data collection at $173(2) \text{ K}$.¹ A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 135 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 15 seconds and a detector distance of 4.91 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.77 \AA . Four major sections of frames were collected with 0.30° steps in ω at four different ϕ settings and a detector position of -28° in 2θ . The intensity data were corrected for absorption and decay (SADABS).² Final cell constants were calculated from the xyz centroids of 3335 strong reflections from the actual data collection after integration (SAINT).³ Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR97⁴ and refined using SHELXL-97.⁵ The space group $P2_1/n$ was determined based on systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. The COD ligand ethylene hydrogen atoms were found from the difference map and refined with individual isotropic displacement parameters. All remaining hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0473$ and $wR2 = 0.0873$ (F^2 , all data).

Structure description

The structure is the one suggested. All atoms lie on general positions. The axial positions of the potassium atom are coordinated by close contacts with COD ligands. The twist angle is 89.1 degrees: the anion is tetrahedral.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-Ray Crystallographic Laboratory.

Some equations of interest:

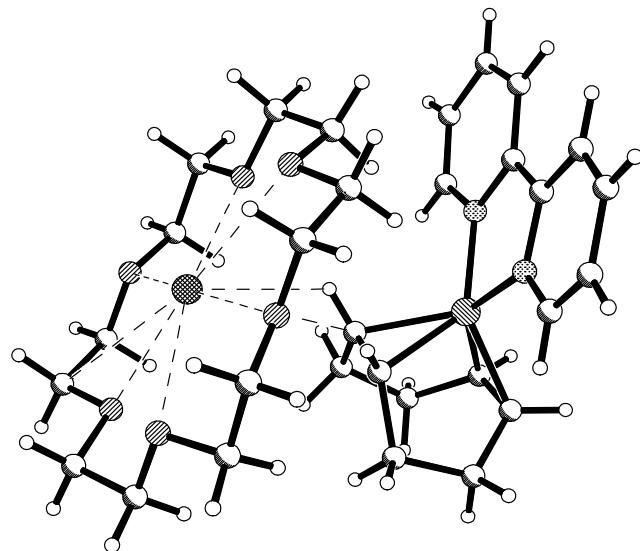

$$R_{\text{int}} = \sum |F_{\text{o}}^2 - \langle F_{\text{o}}^2 \rangle| / \sum |F_{\text{o}}^2|$$

$$R_1 = \sum |F_{\text{o}}| - |F_{\text{c}}| / \sum |F_{\text{o}}|$$

$$wR2 = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \sum [w(F_{\text{o}}^2)^2]]^{1/2}$$

where $w = q / [\sigma^2 (F_{\text{o}}^2) + (a^*P)^2 + b^*P + d + e^*\sin(\theta)]$

$$\text{GooF} = S = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$

Minneapolis, MN 55455

Data collection

A crystal (approximate dimensions 0.45 x 0.45 x 0.40 mm³) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Bruker SMART Platform CCD diffractometer for a data collection at 223(2) K.¹ A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 134 reflections. At the normal operating temperature of 173 K, the unit cell was very close to orthorhombic; but refinement of the data led to no satisfactory result in crystal systems monoclinic (with a twin law) or orthorhombic. Data collected at 123 K provided slightly better, but unpublishable, results—very likely an even colder temperature would allow the crystal to settle fully into a twinned monoclinic setting. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 30 seconds and a detector distance of 4.97 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.84 Å. Four major sections of frames were collected with 0.30° steps in ω at four different ϕ settings and a detector position of -28° in 20. The intensity data were corrected for absorption and decay (SADABS).² Final cell constants were calculated from the xyz centroids of 3450 strong reflections from the actual data collection after integration (SAINT).³ Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR97⁴ and refined using SHELXL-97.⁵ The space group *Pnnm* was determined based on systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. All hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The uncoordinated THF solvent molecule (see below) was highly disordered over a mirror plane and the reflections contributing to it were removed using program PLATON, function SQUEEZE,⁶ which calculated a total solvent space of 599.6 Å³ containing 152 electrons per unit cell. This is equivalent to approximately four THF molecules, the expected number. The CheckCIF utility at the IUCR website shows some level A (serious) alerts for the refinement. The alerts for the carbon atoms whose thermal parameters are small relative to their methyl neighbors are known to appear incorrectly for terminal groups like the *tert*-butyl. The same alert for K2 is due to the high level of disorder in the axially coordinated THF solvent. The final full matrix least squares refinement converged to $R1 = 0.0541$ and $wR2 = 0.1516$ (F^2 , all data).

Structure description

The structure is the one suggested. The cobalt atom lies on a crystallographic mirror plane. The ligand containing atom N1 is modeled as disordered over a crystallographic mirror plane (50:50). The ligand containing N2 lies on the same plane such that methyl group C8 is across the mirror from its symmetry equivalent. The ligand containing

N3 also lies on the mirror plane, but the methyl groups are disordered over it (50:50). Due to the mirror plane, the symmetry equivalent of ligand N1 is the fourth ligand and the overall geometry is exactly tetrahedral. The charge is balanced by two independent potassium 18-crown-6 bis(THF) cations in which the potassium atoms lie on 2/m special positions (1/4 occupancy each). The axial THF solvent molecules are doubly disordered over a mirror plane and two general positions (50:50, 61:39 and 50:50, 63:37). The uncoordinated THF solvent molecule was highly disordered and could not be modeled satisfactorily; its reflection contributions were removed using program PLATON, function SQUEEZE⁶ (see above).

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-Ray Crystallographic Laboratory.

Some equations of interest:

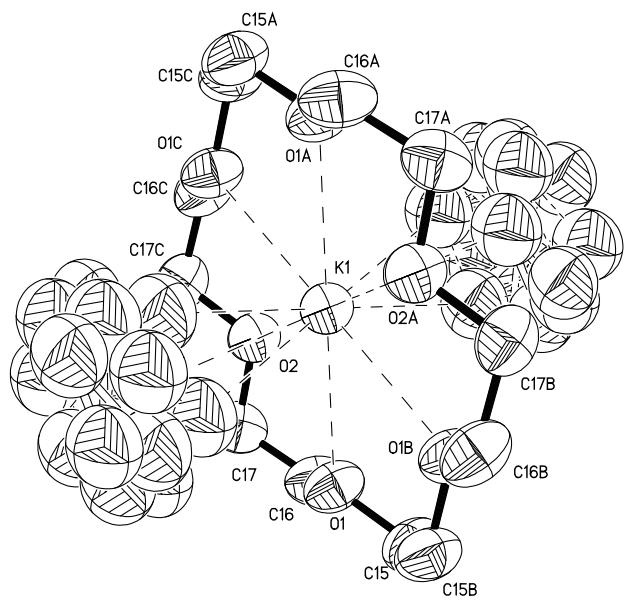

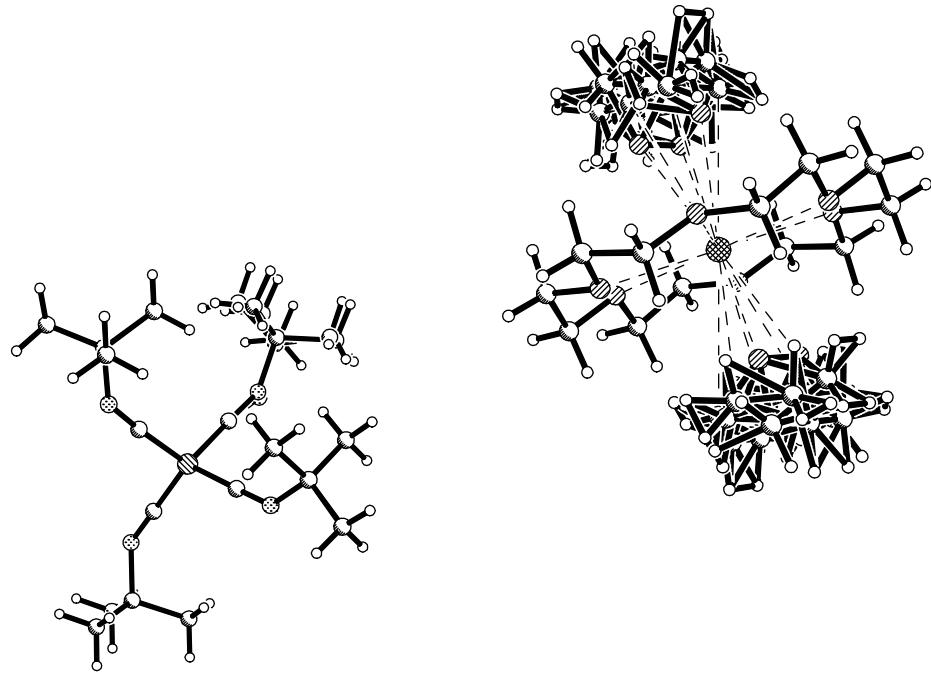

$$R_{\text{int}} = \Sigma |F_{\text{o}}|^2 - \langle F_{\text{o}}^2 \rangle / \Sigma |F_{\text{o}}|^2$$

$$R_1 = \Sigma |F_{\text{o}}| - |F_{\text{c}}| / \Sigma |F_{\text{o}}|$$

$$wR2 = [\Sigma [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \Sigma [w(F_{\text{o}}^2)^2]]^{1/2}$$

$$\text{where } w = q / [\sigma^2 (F_{\text{o}}^2) + (a*P)^2 + b*P + d + e*\sin(\theta)]$$

$$\text{GooF} = S = [\Sigma [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$

Minneapolis, MN 55455

Data collection

A crystal (approximate dimensions $0.42 \times 0.18 \times 0.12 \text{ mm}^3$) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Siemens SMART Platform CCD diffractometer for a data collection at 173(2) K. A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 72 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 45 seconds and a detector distance of 4.90 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.84 Å. Three major sections of frames were collected with 0.30° steps in ω at three different ϕ settings and a detector position of -28° in 2θ . The intensity data were corrected for absorption and decay (SADABS).¹ Final cell constants were calculated from the xyz centroids of 3702 strong reflections from the actual data collection after integration (SAINT).² Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR97³ and refined using SHELXL-97.⁴ The space group $C2/c$ was determined based on systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. All hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0635$ and $wR2 = 0.1814$ (F^2 , all data).

Structure description

The structure is similar to the one suggested. It is a double salt of KCp and K[Co(C₁₄H₁₀)₂]. The potassium cations are complexed by 18-crown-6 ethers. Between K1 and K2 lies a Cp anion, making the entire unit a +1 cation. The outer portions of the potassium cations (outer axial positions) are occupied by THF solvent molecules, one of which is disordered over a two-fold axis (50:50). There is one additional THF solvent molecule in the asymmetric unit. The Co(C₁₄H₁₀)₂ anion is similar to those seen in previous structures. All atoms, except for the THF solvent molecule noted above, lie on general positions. The other two THF solvent molecules are modeled as disordered, each over two positions (60:40 and 73:27). Due to the disorders, all THF solvent molecules were restrained to be ideal.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-

Ray Crystallographic Laboratory.

Some equations of interest:

$$R_{\text{int}} = \sum |F_{\text{o}}^2 - \langle F_{\text{o}}^2 \rangle| / \sum |F_{\text{o}}^2|$$

$$R_1 = \sum |F_{\text{o}}| - |F_{\text{c}}| / \sum |F_{\text{o}}|$$

$$wR2 = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \sum [w(F_{\text{o}}^2)^2]]^{1/2}$$

where $w = q / [\sigma^2 (F_{\text{o}}^2) + (a*P)^2 + b*P + d + e*\sin(\theta)]$

$$\text{GooF} = S = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$

Unit cell dimensions	<i>a</i> = 27.534(3) Å	α = 90°	
	<i>b</i> = 9.7976(9) Å	β = 96.106(2)°	
	<i>c</i> = 49.465(5) Å	γ = 90°	
Volume	13268(2) Å ³		
<i>Z</i>	8		
Density (calculated)	1.269 Mg/m ³		
Absorption coefficient	0.447 mm ⁻¹		
<i>F</i> (000)	5408		
Crystal color, morphology	red-black, needle		
Crystal size	0.42 x 0.18 x 0.12 mm ³		
Theta range for data collection	1.49 to 25.05°		
Index ranges	-25 ≤ <i>h</i> ≤ 32, -11 ≤ <i>k</i> ≤ 11, -58 ≤ <i>l</i> ≤ 58		
Reflections collected	37286		
Independent reflections	11749 [<i>R</i> (int) = 0.0557]		
Observed reflections	5887		
Completeness to theta = 25.05°	99.8%		
Absorption correction	Multi-scan		
Max. and min. transmission	1.000000 and 0.796189		
Refinement method	Full-matrix least-squares on <i>F</i> ²		
Data / restraints / parameters	11749 / 81 / 799		
Goodness-of-fit on <i>F</i> ²	1.005		
Final <i>R</i> indices [<i>I</i> >2sigma(<i>I</i>)]	<i>R</i> 1 = 0.0635, <i>wR</i> 2 = 0.1532		
<i>R</i> indices (all data)	<i>R</i> 1 = 0.1284, <i>wR</i> 2 = 0.1814		
Extinction coefficient	0.00026(5)		
Largest diff. peak and hole	0.363 and -0.345 e.Å ⁻³		

Table 2. Atomic coordinates ($x \times 10^4$) and equivalent isotropic displacement parameters ($\text{\AA}^2 \times 10^3$) for 04172. U_{eq} is defined as one third of the trace of the orthogonalized U_{ij} tensor.

Department of Chemistry

University of Minnesota

207 Pleasant St. S.E.

Minneapolis, MN 55455

Data collection

A crystal (approximate dimensions 0.50 x 0.20 x 0.20 mm³) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Bruker SMART Platform CCD diffractometer for a data collection at 173(2) K.¹ A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 61 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 15 seconds and a detector distance of 4.99 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.78 Å. Four major sections of frames were collected with 0.30° steps in ω at four different ϕ settings and a detector position of -28° in 2 θ . The intensity data were corrected for absorption and decay (SADABS).² Final cell constants were calculated from the xyz centroids of 3885 strong reflections from the actual data collection after integration (SAINT).³ Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR97⁴ and refined using SHELXL-97.⁵ The space group *P*-1 was determined based on the lack of systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. Hydrogen atoms on C1, C2, C3, and C4 were found from the difference map and refined with individual isotropic displacement parameters. All remaining hydrogen atoms, including those of the ethylene ligands (due to disorder), were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R_1 = 0.0403$ and $wR_2 = 0.1154$ (F^2 , all data).

Structure description

The structure is the one suggested. All atoms lie on general positions and the cation and anion are well separated. The ethylene ligands are modeled as disordered over two positions (64:36), with no restraints or constraints applied in order to avoid a presupposed model (i.e., the C—C distances are not necessarily equal). This leads to a slight range in the bondlengths, but all values lie within three standard uncertainties. The dihedral (fold) angle of the anthracene ligand is 26.24(13) degrees. There are two twist angles (due to the disorder) of 82.4 and 80.5 degrees—the geometry of the anion is essentially tetrahedral.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-

Ray Crystallographic Laboratory.

Some equations of interest:

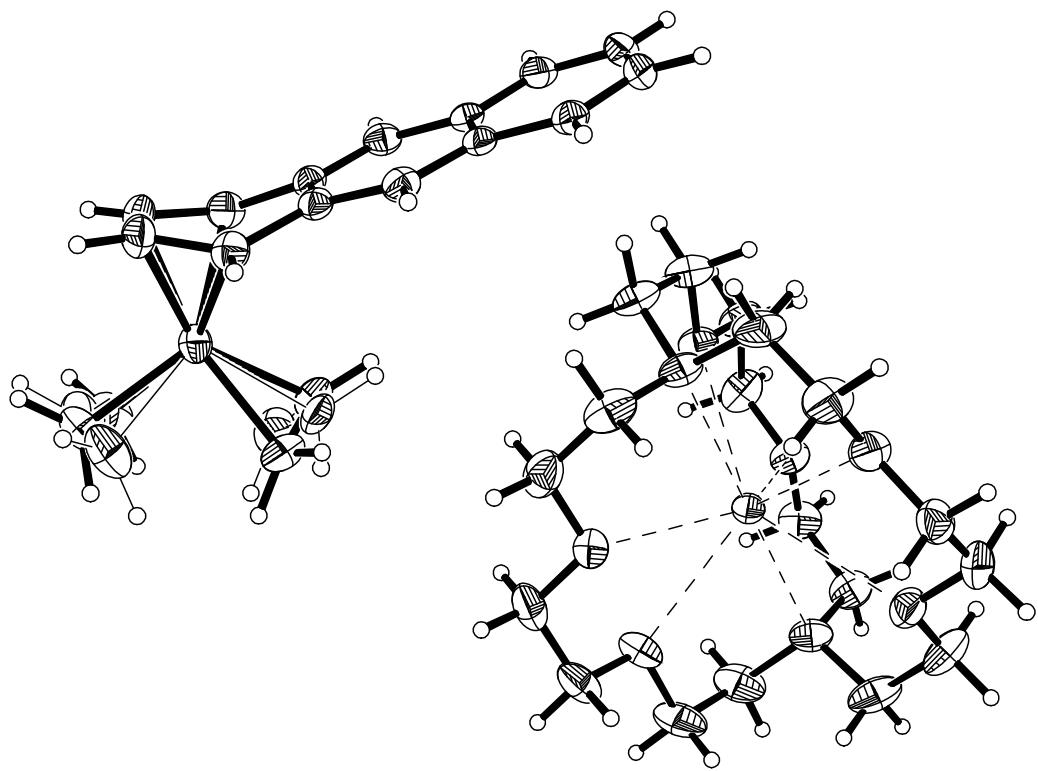

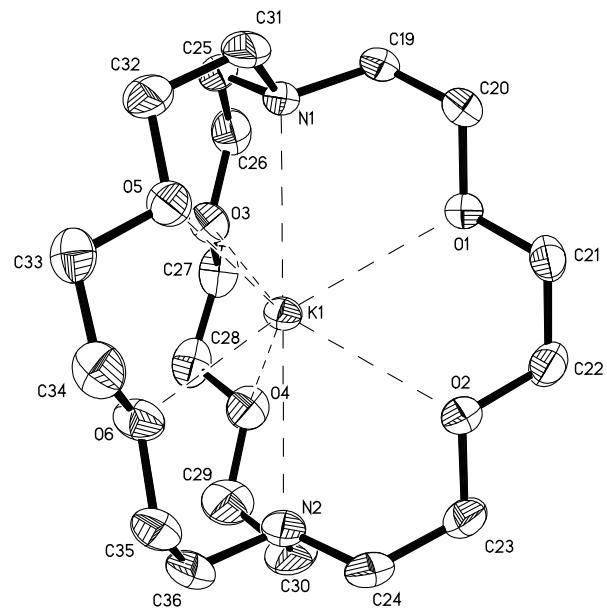

$$R_{\text{int}} = \sum |F_{\text{o}}^2 - \langle F_{\text{o}}^2 \rangle| / \sum |F_{\text{o}}^2|$$

$$R_1 = \sum |F_{\text{o}}| - |F_{\text{c}}| / \sum |F_{\text{o}}|$$

$$wR2 = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \sum [w(F_{\text{o}}^2)^2]]^{1/2}$$

where $w = q / [\sigma^2(F_{\text{o}}^2) + (a*P)^2 + b*P + d + e*\sin(\theta)]$

$$\text{GooF} = S = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$

Data collection

A crystal (approximate dimensions 0.24 x 0.20 x 0.20 mm³) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a Bruker SMART Platform CCD diffractometer for a data collection at 173(2) K.¹ A preliminary set of cell constants was calculated from reflections harvested from three sets of 20 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 54 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 45 seconds and a detector distance of 4.81 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.84 Å. Three major sections of frames were collected with 0.30° steps in ω at three different ϕ settings and a detector position of -28° in 2 θ . The intensity data were corrected for absorption and decay (SADABS).² Final cell constants were calculated from the xyz centroids of 3084 strong reflections from the actual data collection after integration (SAINT).³ Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using SIR97⁴ and refined using SHELXL-97.⁵ The space group $P2_12_12$ was determined based on systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. All hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0429$ and $wR2 = 0.1037$ (F^2 , all data).

Structure description

The structure is the one suggested. The axial positions of the potassium 18-crown-6 cation are occupied by the COD ligand of the anion and a solvent THF molecule, which is modeled as doubly disordered over a crystallographic two-fold axis (50:50, 73:37). One of the PMe₃ groups is modeled as disordered (50:50) due to the presence of its nearby symmetry equivalent. The twist angle of 88.7° means that the overall geometry is tetrahedral.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, S146 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include William W. Brennessel as a coauthor or 2) acknowledge William W. Brennessel, Victor G. Young, Jr., and the X-Ray Crystallographic Laboratory.

Some equations of interest:

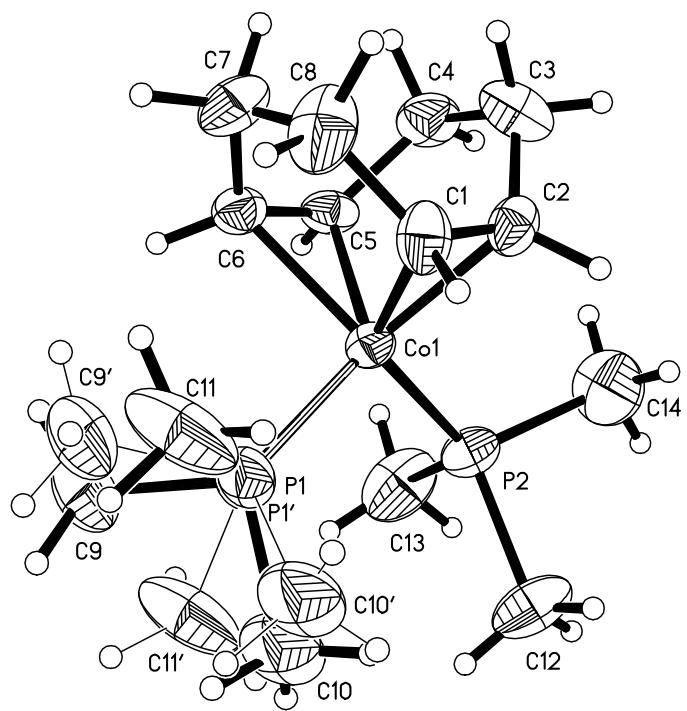

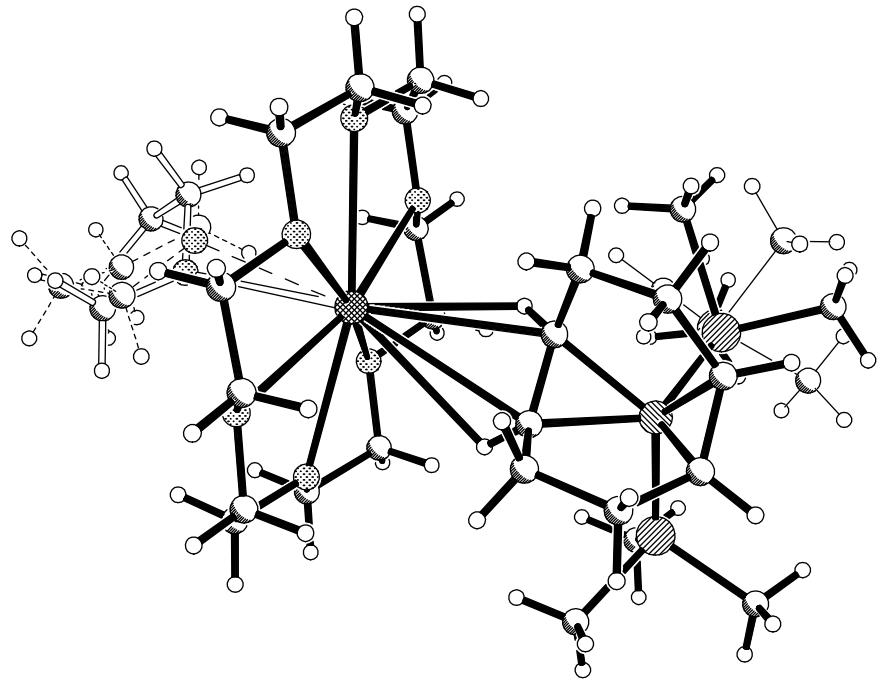

$$R_{\text{int}} = \sum |F_{\text{o}}^2 - \langle F_{\text{o}}^2 \rangle| / \sum |F_{\text{o}}^2|$$

$$R_1 = \sum |F_{\text{o}}| - |F_{\text{c}}| / \sum |F_{\text{o}}|$$

$$wR2 = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \sum [w(F_{\text{o}}^2)^2]]^{1/2}$$

where $w = q / [\sigma^2 (F_{\text{o}}^2) + (a*P)^2 + b*P + d + e*\sin(\theta)]$

$$\text{GooF} = S = [\sum [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$
