## 1- General experimental methods

All reactions were performed under an atmosphere of dry argon in flame dried glassware equipped with a magnetic stir bar. Schlenk tube technique was used for $\mathrm{SmI}_{2}$-mediated reactions. THF was distilled from sodium/benzophenone, DMF from $\mathrm{CaH}_{2}$. THF, HFIP, $t$ - BuOH and $\mathrm{H}_{2} \mathrm{O}$ used in $\mathrm{SmI}_{2}-$ mediated reactions were degassed by freeze and thaw method. Reactions were monitored by thin layer chromatography (TLC) using commercial aluminum-backed silica gel plates (Merck Kiesegel $60 \mathrm{PF}_{254}$ ). TLC spots were viewed under UV light at 254 nm and by heating the plate after treatment with a staining agent $\left(\mathrm{KMnO}_{4}\right.$ or triphenyl tetrazolium chloride). Product purification by gravity column chromatography was performed using Merck Silica Gel 60 ( $70-230$ mesh). Infrared spectra were obtained on a Nicolet Avatar 330 FT-IR spectrometer (spectrometer A) using KBr pellets or on a Nicolet 'Magna 550' spectrometer (spectrometer B) using an ATR (Attenuated Total Reflexion) module. The data are reported in reciprocal centimeters $\left(\mathrm{cm}^{-1}\right)$. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded in $\mathrm{CDCl}_{3}$, chemical shifts for ${ }^{1} \mathrm{H}$ spectra are values from tetramethylsilane in $\mathrm{CDCl}_{3}$ ( $\delta$ 0.00 ), chemical shifts for ${ }^{13} \mathrm{C}$ spectra are values from $\mathrm{CDCl}_{3}(\delta 77.16)$. ${ }^{1} \mathrm{H}$ NMR spectra are reported as follows: chemical shift (ppm), multiplicity (br: boad; s: singlet; d: doublet; t: triplet; q: quadruplet; m : multiplet, app t : apparent triplet), integration and coupling constants (Hz). Low resolution mass spectra (LRMS) were recorded on a Bruker Esquire 3000+ spectrometer. High resolution mass spectra (HRMS) were recorded on a Thermoquest Orbitrap spectrometer. Optical rotations were determined with a Perkin-Elmer 341 polarimeter. Melting points were measured using a Yanaco MP500 micro melting point apparatus and were not corrected.

## 2- Preparation of $0.1 \mathbf{M}$ solution of $\mathrm{SmI}_{2}$ in THF

Distilled and degassed THF ( 50 mL ) was added to samarium metal ( 4 g ) under inert atmosphere. The resulting suspension was cooled down to $0{ }^{\circ} \mathrm{C}$ then sublimated iodine ( 5 g ) was added. The temperature was allowed to reach room temperature and distilled and degassed THF ( 150 mL ) was added. The suspension was stirred at room temperature until the appearance of typical blue color.

## 3- Typical experimental procedures

### 3.1 Screening of conditions for cross coupling of nitrone 1a and allenoate 3a

According to the conditions previously described for the reductive coupling of nitrones with acrylic esters, nitrone 1a and allenoate 3a (1.4 equiv) were first treated with 3 equiv $\mathrm{SmI}_{2}$ in the presence of degased water, at $-78{ }^{\circ} \mathrm{C} .{ }^{1}$ Under these conditions, the expected $N$-hydroxyamine $4 \mathbf{4 a}$ was formed ( $30 \%$ ), nitrone 1a was recovered ( $44 \%$ ) along with a major side-product ( $\mathbf{6 a}$ ), resulting from the reduction of allenoate 3a by $\mathrm{SmI}_{2}$ (see Table, entry 1). Performing the reaction at $-40{ }^{\circ} \mathrm{C}$ did not induce any significant change in the distribution of the products (see Table, entry 2).
In light of the work of Ellman, ${ }^{2}$ who observed that both lithium bromide and water should be used as additives for achieving high yields and good diastereoselectivities in the $\mathrm{SmI}_{2}$-mediated reductive coupling of methyl methacrylate with a $N$-tert-butanesulfinyl imine, we next introduced 12 equivalents of this salt in the reaction mixture (see Table, entry 3). The yield of 4aa being increased (to $50 \%$ ) in the presence of LiBr , further optimizations were performed in its presence.

The effect of different proton sources on the cross coupling of nitrone $\mathbf{1 a}$ with allenoate $\mathbf{3 a}$ was next investigated. When water was replaced by hexafluoroisopropanol, ${ }^{3}$ a non-coordinating proton source, the yield in 4aa was significantly improved (see Table, entries 4, 5). Tert-butanol, a less expensive, and also non-coordinating additive, proved to have a similar effect (see table, entry 6).
The competitive conjugate reduction of allenoate 3a by $\mathrm{SmI}_{2}$, being the major side reaction hampering the isolation of the desired products in high yields, it was thus decided to introduce the starting allenoate 3a and $\mathrm{SmI}_{2}$, in several sequential portions (see Table, entries 5-7). When 1.4 equiv of allenoate and the nitrone were reacted first in the presence of 3.5 equiv of tert-butanol, 12 equiv of LiBr and 3 equiv of $\mathrm{SmI}_{2}$, followed by addition of 0.6 equiv of allenoate and 1 equiv of $\mathrm{SmI}_{2}$, then another 0.5 equiv of allenoate and 0.5 equiv of $\mathrm{SmI}_{2}$, the desired product 4 aa was obtained in $80 \%$ yield (see Table, entry 7). Progressive introduction of the allenoate by using a syringe-pump did not allow to isolate $\mathbf{4 a a}$ in a better yield (see Table, entry 8).

### 3.2 Typical procedure for the optimized cross coupling of nitrones and allenoates (cf. Table, entry 7): conditions A

( $Z$ )- $N$-(2-methylpropylidene)-1-phenylmethanamine- $N$-oxide $\mathbf{1 a}^{4}$ ( $30.7 \mathrm{mg}, 0.17 \mathrm{mmol}$ ) and LiBr $(180 \mathrm{mg}, 2.1 \mathrm{mmol})$ was dissolved in THF ( 2 mL ) under Ar, and the distilled $t$ - $\mathrm{BuOH}(57 \mu \mathrm{~L}, 0.60$ mmol ) was added, then the solution was cooled to $-40^{\circ} \mathrm{C}$. Then a solution of allenoate $3 \mathrm{a}^{5}(42.1 \mathrm{mg}$, 0.24 mmol ) in THF ( 2.2 mL ) was added slowly at $-40{ }^{\circ} \mathrm{C}$. Thereafter $\mathrm{SmI}_{2}$ (3 equiv 5.2 mL ) was added slowly (in 1.5 min ). 30 min later, TLC showed no more starting allene. Then $\mathbf{3 a}(18.1 \mathrm{mg}, 0.10$ mmol ) in THF ( 1.0 mL ) was added slowly at $-40^{\circ} \mathrm{C}$. The solution turned yellow, then another 1 equiv $\mathrm{SmI}_{2}(1.8 \mathrm{~mL})$ was added. 30 min later, TLC showed the allene was consumed, and the nitrone was more dilute. Then 0.5 equiv allene in THF $(0.8 \mathrm{~mL})$ was added, followed by the addition of 0.5 equiv $\mathrm{SmI}_{2}(0.9 \mathrm{~mL}) .1 .2 \mathrm{~h}$ later, the saturated $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(10 \mathrm{~mL})$ and saturated $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$ were added. Then the mixture was extracted with EtOAc $(3 \times 15 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. Purification by column chromatography

[^2]on silica gel (EtOAC/Pentane $3 / 97 \rightarrow$ EtOAc/Pentane $1 / 6 \rightarrow$ DCM/MeOH 95/5) gave a colorless oil 4aa ( $49 \mathrm{mg}, 80 \%$ ), the recovered $\mathbf{1 a}(4.8 \mathrm{mg}, 16 \%)$ and $\mathbf{6 a}{ }^{6}(50 \mathrm{mg})$.

### 3.3 Typical procedure for the optimized cross coupling of $t$-BS-imines and allenoates: conditions B

(E)-2-Methyl- $N$-(2-methylpropylidene)propane-2-sulfinamide 2a ${ }^{7}$ ( $80 \mathrm{mg}, 0.46 \mathrm{mmol}$ ) and LiBr ( 476 $\mathrm{mg}, 5.48 \mathrm{mmol})$ were dissolved in THF ( 2 mL ) under Ar , then the solution was cooled to $-40{ }^{\circ} \mathrm{C}$. Then allenoate $3 \mathrm{a}^{5}(198.8 \mathrm{mg}, 1.14 \mathrm{mmol})$ in THF ( 2.2 mL ) was added at $-40{ }^{\circ} \mathrm{C}$, followed by the addition of $t$ - $\mathrm{BuOH}\left(152.0 \mu \mathrm{~L}, 1.60 \mathrm{mmol}\right.$ ). Thereafter $\mathrm{SmI}_{2}$ ( 3 equiv 13.7 mL ) was added dropwise. 30 min later, allenoate 3a( $47.7 \mathrm{mg}, 0.27 \mathrm{mmol}$ ) in THF ( 1.0 mL ) was added slowly at $-40{ }^{\circ} \mathrm{C}$. Then another 1 equiv $\operatorname{SmI}_{2}(4.6 \mathrm{~mL})$ was added. 30 min later, 0.5 equiv allenoate 3a in THF ( 0.8 mL ) was added, followed by the addition of 0.5 equiv $\mathrm{SmI}_{2}(2.3 \mathrm{~mL}) .3 \mathrm{~h}$ later, the saturated $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(15 \mathrm{~mL})$ and saturated $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$ were added. Then the mixture was extracted with EtOAc $(3 \times 15 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure. Purification by column chromatography on silica gel (EtOAC/Hexane $1 / 30 \rightarrow 1 / 6 \rightarrow 2 / 3$ ) gave a yellow oil 11a $(136.5 \mathrm{mg}, 85 \%, \mathrm{dr}=5: 1)$. The diasterereomers could not be separated at this stage.

### 3.4 Typical procedure for cyclisation of N -hydroxyamino esters 4 into lactams 5

To a mixture of $\mathbf{4 a a}(35 \mathrm{mg}, 0.1 \mathrm{mmol})$ and zinc dust ( $77 \mathrm{mg}, 1.2 \mathrm{mmol}$ ) was added glacial acetic acid ( 2 mL ). The solution was heated to $80^{\circ} \mathrm{C}$ and treated with ultrasonic. 1 h later, TLC showed 4aa was consumed. Then, 15 mL of saturated $\mathrm{NaHCO}_{3}$ was added to the solution carefully, and the $\mathrm{NaHCO}_{3}$ powder was added till the bubble ceased. The mixture was extracted with EtOAc ( $3 \times 15$ mL ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. Purification by column chromatography on silica gel (EtOAC/Pentane $1 / 4 \rightarrow$ EtOAc/Pentane $1 / 1$ ) gave a colorless oil $\mathbf{5 a}$ ( $22.6 \mathrm{mg}, 99 \%$ ).

## Preparation of benzyl 4-methylpenta-2,3-dienote (9)

To a stirring solution of isobutyryl chloride ( $0.81 \mathrm{~mL}, 7.67 \mathrm{mmol}$ ) and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(18 \mathrm{~mL})$ under Ar , at 0 ${ }^{\circ} \mathrm{C}$, was added $\mathrm{Et} 3 \mathrm{~N}(1.22 \mathrm{~mL}, 8.41 \mathrm{mmol})$ dropwise via cannula. When the addition was complete, the ice bath was removed and the reaction mixture warmed to rt . To the reaction mixture was slowly added a solution of stabilized ylide benzyl 2-(triphenylphosphoranylidene) acetate ( $3 \mathrm{~g}, 7.31 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ dropwise via cannula and the mixture was stirred at rt overnight, then concentrated under reduced pressure to afford a gummy residue. This was treated with pentane/ether ( $50 / 8,58 \mathrm{~mL}$ ) and stirred well, then the solid was filtered and washed with pentane $(2 \times 10 \mathrm{~mL})$. Then the filtrate was concentrated under reduced pressure. Purification by column chromatography on silica gel (eluent: $\mathrm{Et}_{2} \mathrm{O} /$ Pentane $1 / 10$ ) afforded allenoate $9(500 \mathrm{mg}, 33 \%)$ as a colorless oil. ## Ozonolysis of 5a

To a solution of $\mathbf{5 a}(18 \mathrm{mg}, 0.08 \mathrm{mmol})$ in $\mathrm{DCM}(4.0 \mathrm{~mL})$ at $-95^{\circ} \mathrm{C}$ (melting acetone bath), was bubbled ozone until a persistent blue color appeared ( 20 min ). The mixture was purged with argon to remove the excess of ozone and then dimethyl sulfide ( 1 mL ) was added. Then the solution was warmed natually without removing the bath. 2 h later, 10 mL water was added, then it was extracted with EtOAc ( $3 \times 10 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. Purification by column chromatography on silica gel (EtOAC/Pentane $1 / 4 \rightarrow$ EtOAc/Pentane 1/1) gave 1-benzyl-5-isopropylpyrrolidine-2,4-dione ${ }^{14}$ as a yellow oil ( $13.4 \mathrm{mg}, 74 \%$ ). ## Preparation of 5-isopropyl-4-methylenepyrrolidin-2-one (12a)

12a
To a solution of compound $\mathbf{1 1 a}(95 \mathrm{mg}, 0.27 \mathrm{mmol}, \mathrm{dr}=5: 1)$ in methanol ( 5 mL ) was added 0.4 mL of 12 N HCl aqueous solution at room temperature. The mixture was then stirred at rt for 25 h . Then the MeOH was removed under reduced pressure, and the $\mathrm{NaHCO}_{3}(15 \mathrm{~mL})$ was added carefully to the resultant residue. It was extracted with DCM $(3 \times 8 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. Purification by column chromatography on silica gel (EtOAC/Hexane $1 / 4 \rightarrow 1 / 1$ ) gave a yellow solid 12a ( $29 \mathrm{mg}, 77 \%$ ). M.p. $79-80^{\circ} \mathrm{C}$ (EtOAc/Hexane); $[\alpha]_{\mathrm{D}}^{20}-61.9$ (c 1.00, $\mathrm{CHCl}_{3}$ ); IR (neat, spectrometer B) $v_{\text {max }}: 3189,3091$, 2958, 2927, 2892, 2870, 1695, 1660, 1454, 1375, 1340, 1315, 1287, 1230, 1150, $1027 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 6.63(\mathrm{brs}, 1 \mathrm{H}), 5.30-5.10(\mathrm{~m}, 1 \mathrm{H}), 5.10-5.00(\mathrm{~m}, 1 \mathrm{H}), 4.05(\mathrm{brs}, 1 \mathrm{H}), 3.20-2.93(\mathrm{~m}$, $2 \mathrm{H}), 2.05-1.75(\mathrm{~m}, 1 \mathrm{H}), 0.98(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}), 0.88(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}) \mathrm{ppm} ;{ }^{13} \mathrm{C}-\mathrm{NMR}(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta: 176.1,142.7,109.6,64.8,37.2,33.6,18.9,15.9 \mathrm{ppm} . \mathrm{MS}(\mathrm{ESI}) \mathrm{m} / z: 162\left(\mathrm{M}+\mathrm{Na}^{+}, 100\right)$; HRMS (ESI, $m / z$ ) calcd for $\left[\mathrm{C}_{8} \mathrm{H}_{13} \mathrm{NONa}\right]^{+}$: 162.08894; Found: 162.08884.

## Preparation of 5-isopropylpyrrolidine-2,4-dione (13a)

To a solution of 12a ( $48 \mathrm{mg}, 0.36 \mathrm{mmol}$ ) in $\mathrm{DCM}(7 \mathrm{~mL})$ at $-95^{\circ} \mathrm{C}$ (melting acetone bath), was bubbled ozone until a persistent blue color appeared ( 20 min ). The mixture was purged with argon to remove the excess of ozone and then dimethyl sulfide $(0.5 \mathrm{~mL})$ was added. Then the solution was
warmed to rt over 1 h . The solution was concentrated under reduced pressure, then the residue was purified by column chromatography on silica gel (EtOAC/Pentane $1 / 4 \rightarrow 2 / 1$ ) to give a white solid 13a ( $29.2 \mathrm{mg}, 60 \%$ ), which was recrystallized to give enantionpure 13a. M.p. $137-138{ }^{\circ} \mathrm{C}$ (EtOAc/Hexane); $[\alpha]^{20}{ }_{\mathrm{D}}-42.3(\mathrm{c} 0.32, \mathrm{EtOH})\left\{\mathrm{lit}{ }^{18}-46.4\right.$ (c 1.00, EtOH) $;$; IR ( KBr , spectrometer A) $v_{\max }: 3174,3098,2967,2927,2875,1769,1705,1656,1385,1357,1333,1311,1278,1244,1125$, 1086, $1037 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 7.24$ (brs, 1H), $3.88(\mathrm{~d}, J=4.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.01-2.94 $(\mathrm{m}, 2 \mathrm{H}), 2.24-2.11(\mathrm{~m}, 1 \mathrm{H}), 1.04(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}), 0.93(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}) \mathrm{ppm} ;{ }^{13} \mathrm{C}-\mathrm{NMR}(100$ $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 207.3,171.8,69.5,41.4,30.9,18.8,16.6 \mathrm{ppm}$; MS (ESI) $\mathrm{m} / \mathrm{z} 164\left(\mathrm{M}+\mathrm{Na}^{+}, 100 \%\right)$;
