# New insights into Frustrated Lewis Pairs: Structural investigations of intramolecular phosphane-borane adducts by using modern Solid State NMR techniques and DFT calculations 

Thomas Wiegand ${ }^{[a]}$, Hellmut Eckert ${ }^{[2]}$, Olga Ekkert ${ }^{[b]}$, Roland Fröhlich ${ }^{[b]}$, Gerald Kehr ${ }^{[b]}$, Gerhard Erker ${ }^{[b] *}$ Stefan Grimme ${ }^{[b]_{*}}$

## Supporting Information

General Procedures. All syntheses involving air- and moisture sensitive compounds were carried out using standard Schlenk-type glassware (or in a glove box) under an atmosphere of argon. Solvents were dried with the procedure according to Grubbs (A. B. Pangborn, M. A. Giardello, R. H. Grubbs, R. K. Rosen, F. J. Timmers, Organometallics 1996, 15, 1518-1520) or were distilled from appropriate drying agents and stored under an argon atmosphere. NMR spectra were recorded on a Bruker AV $300\left({ }^{1} \mathrm{H}: 300 \mathrm{MHz},{ }^{13} \mathrm{C}: 76 \mathrm{MHz},{ }^{31} \mathrm{P}: 121 \mathrm{MHz},{ }^{11} \mathrm{~B}\right.$ : $\left.96 \mathrm{MHz},{ }^{19} \mathrm{~F}: 282 \mathrm{MHz}\right)$ and on a Agilent DD2-600 MHz ( ${ }^{1} \mathrm{H}: 600 \mathrm{MHz},{ }^{13} \mathrm{C}: 151 \mathrm{MHz},{ }^{19} \mathrm{~F}$ : $564 \mathrm{MHz},{ }^{11} \mathrm{~B}: 192 \mathrm{MHz},{ }^{31} \mathrm{P}: 243 \mathrm{MHz}$ ). ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR: chemical shifts $\delta$ are given relative to TMS and referenced to the solvent signal. ${ }^{19} \mathrm{~F}$ NMR: chemical shifts $\delta$ are given relative to $\mathrm{CFCl}_{3}$ (external reference), ${ }^{11} \mathrm{~B}$ NMR: chemical shifts $\delta$ are given relative to $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ (external reference), ${ }^{31} \mathrm{P}$ NMR: chemical shifts $\delta$ are given relative to $\mathrm{H}_{3} \mathrm{PO}_{4}$ ( $85 \%$ in $\mathrm{D}_{2} \mathrm{O}$ ) (external reference). NMR assignments were supported by additional 2D NMR experiments. Elemental analyses were performed on a Elementar Vario El III. IR spectra were recorded on a Varian 3100 FT-IR (Excalibur Series). Melting points and decomposition points were obtained with a DSC 2010 (TA Instruments). HRMS was recorded on GTC Waters Micromass (Manchester, UK).

X-Ray crystal structure analyses. Data set was collected with a Nonius KappaCCD diffractometer. Programs used: data collection COLLECT (Nonius B.V., 1998), data reduction Denzo-SMN (Z. Otwinowski, W. Minor, Methods in Enzymology, 1997, 276, 307326), absorption correction Denzo (Z. Otwinowski, D. Borek, W. Majewski, W. Minor, Acta Cryst. 2003, A59, 228-234), structure solution SHELXS-97 (G.M. Sheldrick, Acta Cryst.

1990, A46, 467-473), structure refinement SHELXL-97 (G.M. Sheldrick, Acta Cryst. 2008, A64, 112-122), graphics XP (BrukerAXS, 2000). Thermals ellipsoids are shown with $50 \%$ probability, $R$-values are given for the observed reflections, $w R^{2}$-values are given for all reflections.

Materials. $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$ (12) [(a) Wang, C.; Erker, G.; Kehr, G.; Wedeking, K.; Fröhlich, R. Organometallics, 2005, 24, 4760-4773. (b) Massey, A. Eur. J. 2008, 14, 333-343.] and compound 6 [Ekkert, O.; Kehr, G.; Fröhlich, R.; Erker, G. J. Am. Chem. Soc. 2011, 133, 4610.] were synthesised according to literature procedure.

## Synthesis of Diphenyl(propinyl)phosphine.

Propynyl lithium ( $1.00 \mathrm{~g}, 21.7 \mathrm{mmol}$ ) was suspended in diethylether ( 15 ml ) and cooled to $-78^{\circ} \mathrm{C}$ and chlorodiphenylphosphane ( $4.01 \mathrm{ml}, 21.7 \mathrm{mmol}$ ) was added. Subsequently the suspension was stirred for 3 h at room temperature. The solvent was removed in vacuum and the residue was extracted (under argon) with pentane ( 30 ml ) via filter cannula. Evaporation of pentane gave the product ( $3.60 \mathrm{~g}, 16.1 \mathrm{mmol}, 74 \%$ ) as a red oil.
${ }^{1} \mathbf{H}$ NMR $\left(300 \mathrm{MHz}, 300 \mathrm{~K}, \mathrm{C}_{6} \mathrm{D}_{6}\right): \delta=7.72(\mathrm{~m}, 4 \mathrm{H}, \mathrm{Ph}), 7.05(\mathrm{~m}, 6 \mathrm{H}, \mathrm{Ph}), 1.52\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{PH}}=\right.$ $1.7 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ).
${ }^{13} \mathbf{C}\left\{{ }^{1} \mathbf{H}\right\} \mathbf{N M R}\left(76 \mathrm{MHz}, 300 \mathrm{~K}, \mathrm{C}_{6} \mathrm{D}_{6}\right): \delta=137.7\left(\mathrm{~d},{ }^{1} J_{\mathrm{PC}}=7.4 \mathrm{~Hz}, i-\mathrm{Ph}\right), 132.9\left(\mathrm{~d},{ }^{2} J_{\mathrm{PC}}=\right.$ $21.0 \mathrm{~Hz}, o-\mathrm{Ph}), 129.0(p-\mathrm{Ph}), 128.8\left(\mathrm{~d},{ }^{3} J_{\mathrm{PC}}=7.4 \mathrm{~Hz}, m-\mathrm{Ph}\right), 106.1\left(\mathrm{~d},{ }^{2} J_{\mathrm{PC}}=4.4 \mathrm{~Hz},{ }^{\mathrm{CH}_{3}} \mathrm{C} \equiv\right)$, $76.0\left(\mathrm{~d}^{1}{ }^{1} \mathrm{PCC}=3.2 \mathrm{~Hz}, \equiv \mathrm{C}^{\mathrm{P}}\right), 4.9\left(\mathrm{~d},{ }^{3} J_{\mathrm{PC}}=1.2 \mathrm{~Hz}, \mathrm{CH}_{3}\right)$.
${ }^{31} \mathbf{P}\left\{{ }^{1} \mathbf{H}\right\} \mathbf{N M R}\left(121 \mathrm{MHz}, 300 \mathrm{~K}, \mathrm{C}_{6} \mathrm{D}_{6}\right): \delta=-32.1\left(v_{1 / 2} \sim 2 \mathrm{~Hz}\right)$.

Synthesis of 6. $\quad \mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3} \quad(\mathbf{1 2 )} \quad(0.420 \mathrm{~g}, \quad 0.821 \mathrm{mmol}) \quad$ and diphenyl(propinyl)phosphane $(0.184 \mathrm{~g}, 0.821 \mathrm{mmol})$ were dissolved in toluene $(20 \mathrm{ml})$ and stirred for 6 h at $70^{\circ} \mathrm{C}$. Subsequently the solvent was removed and the residue was washed twice with pentane ( 15 ml ) and filtered via cannula. After crystallization from dichloromethane / pentane, compound 6 ( $0.307 \mathrm{~g}, 0.417 \mathrm{mmol}$, $51 \%$ ) was obtained as a white solid. Crystals suitable for X-ray crystal structure analysis were grown by slow diffusion of pentane into a solution of 6 in dichloromethane at $-36^{\circ} \mathrm{C}$. Anal. Calc. for $\mathrm{C}_{33} \mathrm{H}_{13} \mathrm{BF}_{15} \mathrm{P}: \mathrm{C}, 53.84 ; \mathrm{H}, 1.78$. Found: C, 54.51; H, 1.58. HRMS: Calc. for $\left(\mathrm{C}_{33} \mathrm{H}_{13} \mathrm{BF}_{15} \mathrm{P}\right) \mathrm{CF}_{3} \mathrm{COO}: 849.04710$. Found: 849.04789. b)

c)

d)

e)

Figure S7: Tensor orientations of the ${ }^{11}$ B electric field gradients for $\mathbf{1 0}$ (a), $\mathbf{1}$ (b), $\mathbf{7}$ (c), $\mathbf{8}$ (d) and 9 (e) obtained by DFT calculations on a GGA level (B97-D) with a slightly modified def2-TZVP basis set (for details see experimental section). In nearly all cases a slight deviation from parallel alignment between the largest principal component $V_{z z}$ and the $\mathrm{B}{ }^{\cdots} \mathrm{P}$ vector is observed (for detailed values see Table 1).

Figure S8: Single data point of a ${ }^{31} \mathrm{P}\left\{{ }^{11} \mathrm{~B}\right\}$ REDOR experiment acquired at 9.4 T with a rotor frequency of 10 kHz and an evolution time of 0.4 ms (continuous line: $\mathrm{S}_{0}$, dotted line: S ) for 4. The signal at 24 ppm shows a significant dephasing due to heteronuclear dipolar interactions leading to the assignment of this resonance to the phosphorus site forming the adduct with boron. This is also confirmed by DFT calculations of magnetic shieldings on the B3-LYP/def2-TZVP level of theory: $\delta(\mathrm{P} \ldots \mathrm{B})=23.6 \mathrm{ppm}$ and $\delta\left(\mathrm{PPh}_{2}\right)=-10.1 \mathrm{ppm}$.

Figure S9: Top: ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ CPMAS spectra acquired at 7.1 T with the SW-TPPM- 15 decoupling scheme (left) and at 9.4 T with the TPPM-15 decoupling sequence (right) for compound $\mathbf{1}$ (A), 3 (B), 5 (C) and $\mathbf{6}$ (D). Bottom: Peak deconvolution (straight line) consisting of ${ }^{31} \mathrm{P},{ }^{11} \mathrm{~B}$ coupling (dotted line) and ${ }^{31} \mathrm{P},{ }^{10} \mathrm{~B}$ coupling (dashed line).

Table S10: Calculated Wiberg bond order indices (WBI) and results of a Natural Bond Orbital (NBO) analysis of the $\mathrm{B} \cdots \mathrm{P}$ bond for the bridged $\mathrm{B} / \mathrm{P}$ adducts illustrating a significant covalent interaction. ${ }^{\text {a }}:$ DFT (TPSS-D3/def2-TZVP), ${ }^{\text {b }}:$ Obtained from an NBO analysis (TPSS/def2-TZVP). The NBO analysis reveals in all cases a real covalent bond between the Lewis acid and base functionalities.

Figure S11: DFT calculated ${ }^{31} \mathrm{P}^{\cdots 11} \mathrm{~B} J$ coupling constants (B3-LYP, TZVP) for the Lewis acid/-base adduct $\mathbf{1 0}$ with varied boron phosphorus distances in the framework of the crystal structure. The data show a strong distance-dependence of the coupling constants (filled circles). Filled stars show the experimentally determined coupling constants of the substituted vinylene linked intramolecularB/P adducts, while filled squares represent DFT calculated values.

Figure S12: Model of $\mathbf{1}$ in which the Lewis acid and -base moiety are oriented trans to each other (dihedral angle $173^{\circ}$ ). The structure was obtained by a full geometry optimization (TPSS-D3, def2-TZVP). The ${ }^{3} J$ coupling (B3-LYP, TZVP) is determined as 18.3 Hz .
