## General Information

The following commercially obtained reagents for the $\mathrm{C}-\mathrm{H}$ amination were used as received: iron(III) phthalocyanine chloride ( $[\mathrm{FePc}] \mathrm{Cl}$, Sigma-Aldrich), 5,10,15,20-Tetraphenyl-21H,23Hporphine iron(III) chloride ( $\mathrm{Fe}(\mathrm{TPP}) \mathrm{Cl}$, Strem), silver hexafluoroantimonate ( $\mathrm{AgSbF}_{6}$, Strem), (diacetoxyiodo)benzene ( $\mathrm{PhI}(\mathrm{OAc})_{2}$, Sigma-Aldrich), bis(tert-butylcarbonyloxy)iodobenzene $\left(\mathrm{PhI}(\mathrm{OPiv})_{2}\right.$, Sigma-Aldrich), and rhodium(II) acetate dimer $\left(\mathrm{Rh}_{2}(\mathrm{OAc})_{4}\right.$, Sigma-Aldrich). All starting materials for the sulfamate ester formation were either commercially available or synthesized according to literature procedures (see end of Supporting Information for synthetic sequences and references). All reactions were run in flame- or oven-dried glassware under an atmosphere of $\mathrm{N}_{2}$ or Ar gas with dry solvents unless otherwise stated. All products were filtered through a glass wool plug prior to obtaining a final weight. Solid reagents were stored in a dessicator or glovebox, and anhydrous solvents were purified by passage through a bed of activated alumina immediately prior to use (Glass Countour, Laguna Beach, California). Deuterochloroform was stored over $3 \AA$ molecular sieves in a secondary container with drierite. $\mathrm{Fe}(R, R$ - PDP$)\left(\mathrm{SbF}_{6}\right)_{2}$ and $\mathrm{Fe}(R, R$-salen $) \mathrm{Cl}$ were prepared according to methods described in the literature ${ }^{1,2}$ and stored at $4^{\circ} \mathrm{C}$. Chlorosulfonyl isocyanate $\left(\mathrm{ClSO}_{2} \mathrm{NCO}\right.$, Sigma-Aldrich or TCI America) was transferred to a Schlenk-type flask and stored at $4^{\circ} \mathrm{C}$ under an inert atmosphere. ${ }^{3}$ Thin-layer chromatography (TLC) was conducted with E. Merck silica gel 60 F254 pre-coated plates $(0.25 \mathrm{~mm})$ and visualized with UV and ethanolic anisaldehyde or potassium permanganate stains. Flash chromatography was performed as described by Still ${ }^{4}$ using American International ZEOprep 60 ECO silica gel (230-400 mesh). Achiral gas chromatographic (GC) analysis was performed on an Agilent 6890N Series instrument equipped with FID detectors using a HP-5 ( $5 \%$-Phenyl)-methylpolysiloxane column ( $30 \mathrm{~m}, 0.32 \mathrm{~mm}, 0.25 \mathrm{~mm}$ ).
${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra were recorded on a Varian Inova-500 ( 500 MHz ) or Varian Unity-500 $(500 \mathrm{MHz})$ spectrometer and are reported in ppm using solvent as an internal standard $\left(\mathrm{CDCl}_{3}\right.$ at $7.26 \mathrm{ppm})$. Data reported as: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{p}=$ pentet, $\mathrm{sxt}=$ sextet, spt $=$ septet, $\mathrm{m}=$ multiplet, $\mathrm{br}=$ broad, app $=$ apparent; coupling constant( s ) in Hz ; integration. Proton-decoupled ${ }^{13} \mathrm{C}$-NMR spectra were recorded on a Varian Unity-500 (125 $\mathrm{MHz})$ spectrometer and are reported in ppm using solvent as an internal standard $\left(\mathrm{CDCl}_{3}\right.$ at 77.16 ppm ). Diastereoselectivity and product selectivity ratios for the intramolecular allylic CH amination reaction were determined by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis of the crude product mixture when possible. IR spectra were recorded as thin films on NaCl plates on a Mattson Galaxy Series FTIR 5000 and are reported in frequency of absorption $\left(\mathrm{cm}^{-1}\right)$. Optical rotations were measured using a 1 mL cell with a 50 mm path length on a Jasco P-1020 polarimeter. Optical rotations were obtained with a sodium lamp and are reported as follows: $[\alpha]_{\lambda} \mathrm{T}^{\circ} \mathrm{C}(\mathrm{c}=\mathrm{g} / 100 \mathrm{~mL}$, solvent $)$. Highresolution mass spectra were obtained at the University of Illinois Mass Spectrometry Laboratory. Electrospray ionization (ESI) spectra were performed on a Waters Q-Tof Ultima spectrometer, and electron ionization (EI) and field desorption (FD) spectra were performed on a Micromass 70-VSE spectrometer.

## Preparation of Sulfamate Ester Starting Materials

## General procedure for preparation of sulfamate ester substrates ${ }^{5}$ Method A:

Preparation of $\mathrm{ClSO}_{2} \mathrm{NH}_{2}$ solution ( 2 M in MeCN ): A 25 mL round-bottom flask equipped with stir bar and rubber septum was charged with $\mathrm{ClSO}_{2} \mathrm{NCO}(653 \mu \mathrm{~L}, 7.50 \mathrm{mmol}, 1.5$ equiv). The flask was cooled to $0^{\circ} \mathrm{C}$, and then neat formic acid ( $283 \mu \mathrm{~L}, 7.50 \mathrm{mmol}, 1.5$ equiv) was added dropwise. After vigorously stirring for 5 min at $0^{\circ} \mathrm{C}, \mathrm{MeCN}(3.8 \mathrm{~mL}, 2 \mathrm{M})$ was added, and the reaction stirred vigorously at $0^{\circ} \mathrm{C}(1 \mathrm{~h})$ then room temp $\left(\sim 20^{\circ} \mathrm{C}\right)$ overnight.
Sulfamate ester formation: A 50 mL round-bottom flask equipped with stir bar and rubber septum was charged with $95 \% \mathrm{NaH}(139 \mathrm{mg}, 5.50 \mathrm{mmol}, 1.1$ equiv) and 5 mL DMF and cooled to $0^{\circ} \mathrm{C}$. The alcohol starting material ( $5.00 \mathrm{mmol}, 1.0$ equiv) in 4 mL DMF was slowly added. The reaction was stirred at room temp. for 1 h , after which it was cooled again to $0^{\circ} \mathrm{C}$. The freshly prepared 2 M MeCN solution of $\mathrm{ClSO}_{2} \mathrm{NH}_{2}$ (vide supra) was then added dropwise via syringe, and the reaction stirred at room temp. for 2-4 h. Upon complete consumption of starting material as monitored by TLC, the reaction was quenched with $\mathrm{H}_{2} \mathrm{O}$ until the mixture turned clear $(\sim 8 \mathrm{~mL})$. The reaction mixture was partitioned between $15 \mathrm{~mL} \mathrm{H}_{2} \mathrm{O}$ and $60 \mathrm{~mL} \mathrm{Et}_{2} \mathrm{O}$ and separated. The aqueous layer was then extracted with $2 \times 30 \mathrm{~mL} \mathrm{Et}_{2} \mathrm{O}$. The organic layers were combined, dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. Following purification of the crude product via flash column chromatography, the pure product was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and filtered through a short silica plug, then twice dissolved in benzene and concentrated under reduced pressure to remove trace $\mathrm{H}_{2} \mathrm{O}$, then stored in a dessicator until use.

## Method B:

A 50 mL round-bottom flask equipped with stir bar and rubber septum was charged with $\mathrm{ClSO}_{2} \mathrm{NCO}\left(653 \mu \mathrm{~L}, 7.50 \mathrm{mmol}, 1.5\right.$ equiv). The flask was cooled to $0^{\circ} \mathrm{C}$, and then neat formic acid ( $283 \mu \mathrm{~L}, 7.50 \mathrm{mmol}, 1.5$ equiv) was added dropwise. After vigorously stirring for 5 min at $0^{\circ} \mathrm{C}, \mathrm{CH}_{2} \mathrm{Cl}_{2}(3.8 \mathrm{~mL}, 2 \mathrm{M})$ was added, and the reaction stirred vigorously at $0^{\circ} \mathrm{C}(1 \mathrm{~h})$ then room temp. overnight. After cooling the reaction flask back to $0^{\circ} \mathrm{C}$, the alcohol starting material ( 5.00 mmol, 1.0 equiv) with $\mathrm{Et}_{3} \mathrm{~N}$ ( $1.05 \mathrm{~mL}, 7.50 \mathrm{mmol}$, 1.5 equiv) in $7 \mathrm{~mL}_{2} \mathrm{Cl}_{2}$ was slowly added via syringe. After complete addition, the reaction warmed back to room temp. and stirred for 4-6 h. If conversion is low after 3-4 h, additional $\mathrm{Et}_{3} \mathrm{~N}$ (1-2 equiv) can be added. Upon complete consumption of starting material as monitored by TLC, the reaction was quenched with $\mathrm{H}_{2} \mathrm{O}$ until the mixture turned clear ( $\sim 8 \mathrm{~mL}$ ). The reaction mixture was partitioned between 15 mL $\mathrm{H}_{2} \mathrm{O}$ and $30 \mathrm{mLCH} \mathrm{Cl}_{2}$ and separated. The aqueous layer was then extracted with $2 \times 30 \mathrm{~mL}$ $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The organic layers were combined, dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. Following purification of the crude product via flash column chromatography, the pure product was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and filtered through a short silica plug, then twice dissolved in benzene and concentrated under reduced pressure to remove trace $\mathrm{H}_{2} \mathrm{O}$, then stored in a dessicator until use.

## ( $\pm$ )-( $E$ )-1-phenylnon-7-en-4-yl sulfamate (Table 1).

Prepared according to method A. $1.092 \mathrm{~g}(5.00 \mathrm{mmol})$ of $( \pm)-(E)$ -1-phenylnon-7-en-4-ol S1 were used. Flash column chromatography on silica ( 35 mm fritted glass column, 150 mm $\mathrm{SiO}_{2}$ ) using 3:1 hexanes:EtOAc as eluent gave 1.264 g (4.25
mmol ) of pure product as a colorless oil ( $>20: 1 \mathrm{E}: Z, 85 \%$ yield). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 7.30-7.26 (m, 2H), 7.21-7.17 (m, 3H), $5.44(\mathrm{dq}, J=15.5,6.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.39$ (dt, $J=15.0,6.0 \mathrm{~Hz}$, $1 \mathrm{H}), 4.61$ (br. s, 3 H ), 2.65-2.64 (m, 2H), 2.07-2.05 (m, 2H), 1.80-1.70 (m, 6H), $1.64(\mathrm{~d}, J=6.0$ $\mathrm{Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 141.9,129.8,128.6$ (2 peaks), 126.2, 126.1, 84.7, 35.6, $33.9,33.5,28.1,26.5,18.0$; IR (film, $\mathrm{cm}^{-1}$ ) 3381, 3284, 3026, 2933, 2856, 1554, 1496, 1452, 1358, 1180, 914; HRMS (ESI) $m / z$ calculated for $\mathrm{C}_{15} \mathrm{H}_{23} \mathrm{NO}_{3} \mathrm{SNa}[\mathrm{M}+\mathrm{Na}]^{+}: 320.1296$, found 320.1299 .

## ( $\pm$ )-( $E$ )-6-phenylhex-5-en-2-yl sulfamate (Table 2).

Prepared according to method A. $881 \mathrm{mg}(5.00 \mathrm{mmol})$ of $( \pm)-(E)-6-$ phenylhex-5-en-2-ol ${ }^{6}$ were used. Flash column chromatography on silica ( 35 mm fritted glass column, $150 \mathrm{~mm} \mathrm{SiO} \mathbf{O}_{2}$ ) using 2:1 hexanes:EtOAc as eluent gave $919 \mathrm{mg}(3.60 \mathrm{mmol})$ of pure product as a white solid ( $>20: 1$ $E: Z, 72 \%$ yield). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.35-7.28(\mathrm{~m}, 4 \mathrm{H}), 7.23-$ $7.20(\mathrm{~m}, 1 \mathrm{H}), 6.43(\mathrm{~d}, J=15.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.19(\mathrm{dt}, J=15.5,7.0 \mathrm{~Hz}, 1 \mathrm{H})$, 4.80-1.73 (m, 1H), 4.64 (br. s, 2H), 2.37-2.33 (m, 2H), 1.97-1.90 (m, 1H), 1.82-1.76 (m, 1H), $1.47(\mathrm{~d}, J=6.0 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 137.5,131.1,129.1,128.7$, 127.3, 126.2, 81.1, 36.2, 28.7, 20.8; IR (film, $\mathrm{cm}^{-1}$ ) 3383, 3292, 3026, 2980, 2937, 1554, 1446, 1361, 1182, 922; HRMS (ESI) $m / z$ calculated for $\mathrm{C}_{12} \mathrm{H}_{17} \mathrm{NO}_{3} \mathrm{SNa}[\mathrm{M}+\mathrm{Na}]^{+}: 278.0827$, found 278.0837.
( $\pm$ )-6-methylhept-5-en-2-yl sulfamate (Table 2).
Prepared according to method A. $641 \mathrm{mg}(5.00 \mathrm{mmol})$ of $( \pm)-6-$ methylhept-5-
 en-2-ol were used. Flash column chromatography on silica ( 35 mm fritted glass column, $150 \mathrm{~mm} \mathrm{SiO}_{2}$ ) using 4:1 hexanes:EtOAc as eluent gave 800 mg ( 3.86 mmol ) of pure product as a colorless oil ( $77 \%$ yield). ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ( 500 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 5.10-5.07(\mathrm{~m}, 1 \mathrm{H}), 4.80$ (br. s, 2H), $4.70(\mathrm{app} \mathrm{sxt}, J=6.5 \mathrm{~Hz}$, $1 \mathrm{H}), 2.15-2.03(\mathrm{~m}, 2 \mathrm{H}), 1.77$ (ddt, $J=14.0,9.0,6.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.69(\mathrm{~s}, 3 \mathrm{H}), 1.66-1.59(\mathrm{~m}, 1 \mathrm{H})$, $1.61(\mathrm{~s}, 3 \mathrm{H}), 1.43(\mathrm{~d}, J=6.5 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 132.9,123.0,81.5,36.6$, 25.8, 23.8, 20.7, 17.9; IR (film, $\mathrm{cm}^{-1}$ ) 3379, 3288, 2972, 2929, 2858, 1562, 1450, 1358, 1182, 1126 924; HRMS (ESI) $m / z$ calculated for $\mathrm{C}_{8} \mathrm{H}_{17} \mathrm{NO}_{3} \mathrm{SNa}[\mathrm{M}+\mathrm{Na}]^{+}: 230.0827$, found 230.0828.
(土)-2-methylhept-6-en-3-yl sulfamate (Table 2).

Prepared according to method A. $641 \mathrm{mg}(5.00 \mathrm{mmol})$ of $( \pm)$-2-methylhept-6-en-3-ol S2 were used. Flash column chromatography on silica ( 35 mm fritted glass column, 150 mm SiO 2 ) using 3:1 hexanes:EtOAc as eluent gave 674 mg ( 3.25 mmol ) of pure product as a colorless oil ( $65 \%$ yield). ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ( 500 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 5.81$ (ddt, $\left.J=16.5,10.0,6.0 \mathrm{~Hz}, 1 \mathrm{H}\right), 5.07(\mathrm{dd}, J=17.5,1.5$ $\mathrm{Hz}, 1 \mathrm{H}), 5.01$ (dd, $J=10.5,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.75$ (br. s, 2H), 4.47 (dt, $J=7.5,4.5$ $\mathrm{Hz}, 1 \mathrm{H}), 2.24-2.09(\mathrm{~m}, 3 \mathrm{H}), 1.86-1.71(\mathrm{~m}, 2 \mathrm{H}), 0.99(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}), 0.96(\mathrm{~d}, J=6.5 \mathrm{~Hz}$, $3 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 137.6,115.6,89.4,31.1,29.6,29.5,17.7$ (2 peaks); IR (film, $\mathrm{cm}^{-1}$ ) 3381, 3288, 2968, 2879, 1641, 1556, 1468, 1363, 1182, 918; HRMS (ESI) m/z calculated for $\mathrm{C}_{8} \mathrm{H}_{17} \mathrm{NO}_{3} \mathrm{SNa}[\mathrm{M}+\mathrm{Na}]^{+}: 230.0827$, found 230.0826.

## (-)-3ß-cholest-5-enyl sulfamate (Table 2).

Prepared according to method A. $1.934 \mathrm{~g}(5.00 \mathrm{mmol})$ of $3 \beta-$ hydroxycholesterol were used. Due to its insolubility in DMF, cholesterol was dissolved in $\mathrm{CHCl}_{3}(4 \mathrm{~mL})$ instead prior to addition to NaH solution; the general procedure was otherwise exactly followed. Flash column chromatography on silica ( 35 mm fritted glass column, $150 \mathrm{~mm} \quad \mathrm{SiO}_{2}$ ) using 9:1 hexanes:EtOAc as eluent followed by recrystallization from ether (in place of the normal silica plug filtration) gave 1.514 $\mathrm{g}(3.25 \mathrm{mmol})$ of pure product as a white solid ( $65 \%$ yield). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 5.42$ (app. d, $J=5.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 4.64 (br. s, 1H), 4.45 (dddd, $J=11.5,11.5,11.0,11.0 \mathrm{~Hz}$, $1 \mathrm{H}), 2.57-2.52(\mathrm{~m}, 2 \mathrm{H}), 2.10-2.07(\mathrm{~m}, 1 \mathrm{H}), 2.04-1.96(\mathrm{~m}, 2 \mathrm{H}) 1.90(\mathrm{dt}, J=13.5,3.8 \mathrm{~Hz}, 1 \mathrm{H})$, $1.87-1.74(\mathrm{~m}, 2 \mathrm{H}), 1.60-1.43(\mathrm{~m}, 7 \mathrm{H}), 1.38-1.31(\mathrm{~m}, 3 \mathrm{H}), 1.27-1.25(\mathrm{~m}, 1 \mathrm{H}), 1.18-1.05(\mathrm{~m}, 7 \mathrm{H})$, $1.05(\mathrm{~s}, 3 \mathrm{H}), 1.01-0.93(\mathrm{~m}, 2 \mathrm{H}), 0.92(\mathrm{~d}, J=6.5 \mathrm{~Hz}, 3 \mathrm{H}), 0.87(\mathrm{dd}, J=6.5,2.5 \mathrm{~Hz}, 6 \mathrm{H}), 0.68(\mathrm{~s}$, $3 \mathrm{H})$; ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 139.0,123.8,83.5,56.8,56.3,50.2,42.5,39.9,39.7,38.9$, $37.1,36.6,36.3,35.9,32.1,32.0,28.7,28.4,28.2,24.4,24.0,23.0,22.7,21.2,19.4,18.9,12.0$; IR (film, $\mathrm{cm}^{-1}$ ) $3373,3273,2951,2883,1545,1468,1350,1196,1163,980,958,928 ;[\alpha]^{25}{ }_{\mathrm{D}}=-$ $36.7^{\circ}\left(c=1.2, \mathrm{CHCl}_{3}\right)$; HRMS (CI) $m / z$ calculated for $\mathrm{C}_{27} \mathrm{H}_{47} \mathrm{NO}_{3} \mathrm{SNa}[\mathrm{M}+\mathrm{Na}]^{+}$: 488.3174, found 488.3184.
(土)-1-phenyl-4-methylpentan-3-yl sulfamate (Table 2).

Prepared according to method A. $891 \mathrm{mg}(5.00 \mathrm{mmol})$ of ( $\pm$ )-1-phenyl-5-methylpentan-3-ol S3 were used. Flash column chromatography on silica ( 35 mm fritted glass column, 150 mm SiO 2 ) using $3: 1$ hexanes:EtOAc as eluent gave $901 \mathrm{mg}(3.50 \mathrm{mmol})$ of pure product as a colorless oil $(70 \%$ yield). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.30(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.22-7.19$ $(\mathrm{m}, 3 \mathrm{H}), 4.73$ (br. s, 2 H ), $4.50(\mathrm{dt}, J=7.5,4.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.83-2.77(\mathrm{~m}, 1 \mathrm{H})$, 2.74-2.68 (m, 1H), 2.20-2.13 (m, 1H), 2.07-1.94 (m, 2H), $1.00(\mathrm{~d}, J=6.5 \mathrm{~Hz}, 3 \mathrm{H}), 0.97(\mathrm{~d}, J=$ $6.5 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 141.4,128.7,128.5,126.2,89.4,32.0,31.7,31.2$, 17.9, 17.5; IR (film, $\mathrm{cm}^{-1}$ ) 3388, 3284, 3087, 3064, 3028, 2966, 2937, 2877, 1603, 1554, 1496, 1454, 1360, 1182, 922; HRMS (ESI) $m / z$ calculated for $\mathrm{C}_{12} \mathrm{H}_{19} \mathrm{NO}_{3} \mathrm{SNa}[\mathrm{M}+\mathrm{Na}]^{+}: 280.0983$, found 280.0985 .

## (-)-(4R, $6 R$ )-6,10-dimethylundecan-4-yl sulfamate (Table 2).

Prepared according to method A. $777 \mathrm{mg}(3.92 \mathrm{mmol})$ of a $97: 3$ anti:syn mixture of (-)-(4R, 6R)-6,10-dimethylundecan-4-ol S4 were used, along with NaH ( $109 \mathrm{mg}, 4.31 \mathrm{mmol}, 1.1$ equiv), DMF $(4+3 \mathrm{~mL}), \mathrm{ClSO}_{2} \mathrm{NCO}(511 \mu \mathrm{~L}, 5.88 \mathrm{mmol}, 1.5$ equiv), formic acid ( $222 \mu \mathrm{~L}, 5.88 \mathrm{mmol}, 1.5$ equiv) and $\mathrm{MeCN}(3 \mathrm{~mL})$. Flash column chromatography on silica ( 35 mm fritted glass column, 150 mm SiO 2 ) using 9:1 hexanes:EtOAc as eluent gave 771 mg $(2.76 \mathrm{mmol})$ of pure product as a colorless oil $\left(70 \%\right.$ yield). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 4.73-$ $4.68(\mathrm{~m}, 3 \mathrm{H}), 1.78-1.67(\mathrm{~m}, 3 \mathrm{H}), 1.62-1.60(\mathrm{~m}, 1 \mathrm{H}), 1.54-1.49(\mathrm{~m}, 1 \mathrm{H}), 1.45-1.40(\mathrm{~m}, 2 \mathrm{H}), 1.38-$ $1.30(\mathrm{~m}, 2 \mathrm{H}), 1.29-1.21(\mathrm{~m}, 2 \mathrm{H}), 1.16-1.11(\mathrm{~m}, 3 \mathrm{H}), 0.95(\mathrm{t}, J=7.3 \mathrm{~Hz}, 3 \mathrm{H}), 0.93(\mathrm{~d}, J=6.5 \mathrm{~Hz}$,

( $\pm$ )-4-((1E)-1-propenyl)-6-(3-phenylpropyl)tetrahydro-1,2,3-oxathiazine-2,2-dioxide [1]. In general, the syn and anti oxathiazinanes can be isolated pure via flash column chromatography directly from the crude reaction mixture. The minor (anti) diastereomer co-elutes with starting material under hexanes/EtOAc eluent conditions, but can be easily separated in cases of incomplete conversion when $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexanes is instead used as the eluent system. See general procedure for single catalyst addition for specific experimental details (vide infra). All products were obtained with an olefin geometry of $>20: 1 E / Z$.

The relative stereochemistry of the oxathiazinanes was confirmed via nOe NMR experiments ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) in which the C 4 and C 6 protons for each diastereomer were irradiated (irradiated protons are highlighted in red). Syn oxathiazinanes have a characteristic weak nOe between the C4 and C6 pseudo-axial hydrogens. Conversely, the C4 and C6 hydrogens in the anti oxathiazinane fall on opposite sides of the ring and therefore experience no observable nOe. Instead, for anti allylic C-H amination products a weak nOe can be observed between the C3 vinylic hydrogen of the pseudo-axial propenyl group and the pseudo-axial C6 hydrogen. All products described in this paper are assumed to have the same relative stereochemistry as $\mathbf{1}$ by analogy. The experimental data are consistent with previously reported studies in the literature. ${ }^{8}$

In general, the aziridine is formed in only trace quantities under the standard Fe-catalyzed $\mathrm{C}-\mathrm{H}$ amination conditions. The trace aziridine is more polar than the insertion products and is easily separated from the desired oxathiazinane products via flash column chromatography on silica. Most of the aziridine side products from substrates described in this paper share a characteristic peak near $\delta=3.0 \mathrm{ppm}(1 \mathrm{H})$, which was used to determine ins./azir. ratios in the crude ${ }^{1} \mathrm{H}-\mathrm{NMR}$. ${ }^{1} \mathrm{H}$-NMR spectra showing the $2.5-5.5 \mathrm{ppm}$ region for crude reaction mixtures of each olefincontaining substrate in this paper are presented in a separate supporting information document.

 conditions (vide infra). Purified via flash column chromatography on silica using $4: 1 \rightarrow 2: 1$ hexanes/EtOAc as the eluent system. ## General procedure for single catalyst addition (entries 1-8)

Into a 10 mL round-bottom flask was added $\mathrm{AgSbF}_{6}(13.7 \mathrm{mg}, 0.040 \mathrm{mmol}, 0.10$ equiv, entries $5-7$ ), catalyst ( $0.040 \mathrm{mmol}, 0.10$ equiv), and a stir bar in a glovebox. The flask was then sealed with a rubber septum, covered in aluminum foil (when $\mathrm{AgSbF}_{6}$ was used), and taken out of the box. $( \pm)-(E)$-1-phenylnon-7-en-4-yl sulfamate ( $119 \mathrm{mg}, 0.400 \mathrm{mmol}, 1.0$ equiv) dissolved in solvent was added via syringe, followed by $\mathrm{PhI}\left(\mathrm{O}_{2} \mathrm{CR}\right)_{2}(0.800 \mathrm{mmol}, 2.0$ equiv) in a single portion. After addition of oxidant, the dark turquoise solution gradually turned dark brown. The reaction stirred for 6 h at room temp $\left(\sim 20^{\circ} \mathrm{C}\right)$, and then concentrated under reduced pressure. The remaining dark brown residue was suspended in $\mathrm{Et}_{2} \mathrm{O}$ and filtered through a pad of Celite. Upon removal of solvent under reduced pressure, flash column chromatography on silica allowed separate isolation of each component as colorless oils. When reaction gave $<5 \%$ recovered starting material (rsm), the column conditions were as follows: ( 35 mm fritted glass column, 150 $\mathrm{mm} \mathrm{SiO}_{2}$ ), 5:1 hexanes/EtOAc. For incomplete conversion of starting material, column conditions were as follows: 35 mm fritted glass column, $110 \mathrm{~mm} \mathrm{SiO}_{2}, 4: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hex ( 600 mL ) $\rightarrow 9: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexanes $(350 \mathrm{~mL}) \rightarrow 100 \% \mathrm{CH}_{2} \mathrm{Cl}_{2}$.

Entry 1. Single addition protocol was followed, except product was isolated as a diastereomeric mixture with starting material under the hexanes/EtOAc column conditions. ( $\pm$ )-( $E$ )-9-phenylnon-2-en-6-yl sulfamate ( $119 \mathrm{mg}, 0.400 \mathrm{mmol}, 1.0$ equiv), $\mathrm{Fe}(R, R-\mathrm{PDP})\left(\mathrm{SbF}_{6}\right)_{2}(33.6 \mathrm{mg}$, $0.040 \mathrm{mmol}, 0.10$ equiv $), \mathrm{PhI}(\mathrm{OAc})_{2}(257 \mathrm{mg}, 0.800 \mathrm{mmol}, 2.0$ equiv) and $\mathrm{MeCN}(4.0 \mathrm{~mL}$, 0.1 M ) were used. By ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis of the crude product, ins./azir. was $>20: 1$ and d.r. was ~1:1 (syn:anti).

Run 2: ( 9 mg of $1.2: 1$ syn:anti mixture, $0.032 \mathrm{mmol}, 8 \%$ ), ( $70 \mathrm{mg} \mathrm{rsm}, 0.236 \mathrm{mmol}, 59 \%$ ). Average: $\mathbf{1 0 \%}$ yield, $\mathbf{5 8 \%}$ rsm.

Entry 2. Single addition protocol was followed, except product was isolated as a diastereomeric mixture with starting material under the hexanes/EtOAc column conditions. ( $\pm$ )-( $E$ )-9-phenylnon-2-en-6-yl sulfamate ( $119 \mathrm{mg}, 0.400 \mathrm{mmol}, 1.0$ equiv), $\mathrm{Fe}(\mathrm{TPP}) \mathrm{Cl}(28.2 \mathrm{mg}, 0.040$ $\mathrm{mmol}, 0.10$ equiv $), \mathrm{PhI}(\mathrm{OAc})_{2}(257 \mathrm{mg}, 0.800 \mathrm{mmol}, 2.0$ equiv) and $\mathrm{MeCN}(4.0 \mathrm{~mL}, 0.1 \mathrm{M})$ were used. By ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis of the crude product, ins./azir. was $>20: 1$ and d.r. was $\sim 1: 1$ (syn:anti).
Run 1: (24 mg of 1:1 syn:anti mixture, $0.081 \mathrm{mmol}, 20 \%$ ), ( $53 \mathrm{mg} \mathrm{rsm}, 0.178 \mathrm{mmol}, 45 \%$ ). Run 2: ( 26 mg of 1.1:1 syn:anti mixture, $0.088 \mathrm{mmol}, 22 \%$ ), ( $44 \mathrm{mg} \mathrm{rsm}, 0.148 \mathrm{mmol}, 37 \%$ ). Average: 21\% yield, 41\% rsm.

Entry 3. Single addition protocol was followed; starting material was reisolated via flash column ( 35 mm fritted glass column, 110 mm SiO 2 ) using $4: 1$ hexanes/EtOAc. ( $\pm$ )- $(E)$-9-phenylnon-2-en-6-yl sulfamate ( $119 \mathrm{mg}, 0.400 \mathrm{mmol}, 1.0$ equiv), $\mathrm{Fe}(\mathrm{R}, \mathrm{R}$-salen) Cl ( $22.8 \mathrm{mg}, 0.040 \mathrm{mmol}$, 0.10 equiv), $\mathrm{PhI}(\mathrm{OAc})_{2}(257 \mathrm{mg}, 0.800 \mathrm{mmol}, 2.0$ equiv $)$ and $\mathrm{MeCN}(4.0 \mathrm{~mL}, 0.1 \mathrm{M})$ were used. ${ }^{1} \mathrm{H}$-NMR analysis of the crude product indicated formation of neither the desired insertion product nor aziridine. Due to the presence of an unidentified impurity after column
chromatography, recovery of starting material was determined via ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis using $\mathrm{PhNO}_{2}$ as an internal standard (delay $=60 \mathrm{~s}$ ).

Single catalyst addition protocol for [ FePc$] \mathrm{Cl}-$ mediated intramolecular amination
Into a 10 mL round-bottom flask was added $\mathrm{AgSbF}_{6}(13.7 \mathrm{mg}, 0.040 \mathrm{mmol}, 0.10$ equiv), $[\mathrm{FePc}] \mathrm{Cl}(24.0 \mathrm{mg}, 0.040 \mathrm{mmol}, 0.10$ equiv $)$, and a stir bar in a glovebox. The flask was then sealed with a rubber septum, covered in aluminum foil, and taken out of the box. 4:1 $\mathrm{PhMe}: \mathrm{MeCN}(800 \mu \mathrm{~L}, 0.5 \mathrm{M})$, sulfamate ester ( $0.400 \mathrm{mmol}, 1.0$ equiv), and $\mathrm{PhI}(\mathrm{OPiv})_{2}$ ( 325 mg , $0.800 \mathrm{mmol}, 2.0$ equiv) were then added sequentially; if sulfamate ester was an oil, it was taken up in the solvent mixture and added to the flask via syringe. After addition of oxidant, the deep violet solution gradually turned dark brown. The reaction stirred for 6 h at room temp $\left(\sim 20^{\circ} \mathrm{C}\right)$, then the reaction was concentrated under reduced pressure. The remaining dark brown residue was suspended in $\mathrm{Et}_{2} \mathrm{O}$ and filtered through a pad of Celite. Upon removal of solvent under reduced pressure, flash column chromatography on silica allowed separate isolation of each component.

## Iterative catalyst addition protocol for [ FePc$] \mathrm{Cl}-$ mediated intramolecular amination

$\mathrm{AgSbF}_{6}$ ( $4 \mathrm{x} 4.5 \mathrm{mg}, 0.053 \mathrm{mmol}, 0.13$ equiv) and $[\mathrm{FePc}] \mathrm{Cl}(4 \mathrm{x} 8 \mathrm{mg}, 0.053 \mathrm{mmol}, 0.13$ equiv) were weighed out into four separate $1 / 2$-dram borosilicate vials in a glovebox, sealed, covered in aluminum foil, taken out of the box and temporarily stored in a dessicator. A 10 mL roundbottom flask covered in aluminum foil and equipped with a stir bar and rubber septum was charged with $4: 1 \mathrm{PhMe}: \mathrm{MeCN}(800 \mu \mathrm{~L}, 0.5 \mathrm{M})$, sulfamate ester ( $0.400 \mathrm{mmol}, 1.0$ equiv), and $\mathrm{PhI}(\mathrm{OPiv})_{2}$ ( $325 \mathrm{mg}, 0.800 \mathrm{mmol}, 2.0$ equiv); if sulfamate ester is an oil, it was taken up in the solvent mixture and added to the flask via syringe. The contents of one vial were quickly added to the reaction flask under a stream of $\mathrm{N}_{2}$, and then the rubber septum was replaced. After stirring for 2 h at room temp, a second portion was added in the same manner; this was then repeated twice more in 2 h intervals for a total of four catalyst additions. The reaction stirred for 2 h more at room temp after addition of the final portion for a total reaction time of 8 h , then the solvent was removed under reduced pressure. Work-up and purification were performed in a manner identical to that described in the single catalyst addition protocol (vide supra). The iterative addition protocol was used for substrates that did not react to completion under the standard single catalyst addition reaction conditions. While simply increasing catalyst loading under standard reaction conditions with less reactive substrates did not result in improved reactivity, iterative addition of the precatalyst mixture had a beneficial effect on overall reactivity and yield of the desired product.

## Confirmation of Stereoretention in a Stereochemically Defined $3^{\circ} \mathrm{C}-\mathrm{H}$ Bond

In order to confirm the configuration of the tertiary center in 7 following $\mathrm{C}-\mathrm{H}$ amination under [ FePc$] \mathrm{SbF}_{6}$ catalysis, standards representing each diasteromeric configuration were prepared. A diastereomeric mixture, resulting from the non-selective addition of allylmagnesium bromide to chirally pure ( + )-citronellal, was carried forward for use as a standard for quantitative analysis (vide infra). Authentic standards of each oxathiazinane product, $(+)-$ syn- 7 and (-)-anti-7, were prepared under Rh-catalyzed $\mathrm{C}-\mathrm{H}$ amination conditions. These products are readily separated via flash column chromatography, allowing for full characterization of pure samples of each possible diastereomer that could be formed under the $[\mathrm{FePc}] \mathrm{SbF}_{6}$-catalyzed $\mathrm{C}-\mathrm{H}$ amination conditions. NOTE: the standard that was prepared for the minor diastereomer in each case has the opposite enantiomeric configuration to that which would be formed in the case of epimerization at the reacting tertiary $\mathrm{C}-\mathrm{H}$ center of 7 (if the correct enantiomer is desired, (-)citronellal can instead be used as the starting material).

The relative configurations of (+)-syn-7 and (-)-anti-7 were confirmed based on nOe ${ }^{1} \mathrm{H}-\mathrm{NMR}$ experiments $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$. The ethereal proton peaks at $\delta=4.85 \mathrm{ppm}$ and $\delta=4.85-4.81$ ppm , respectively, were irradiated in each case, and the resulting observed relationships are illustrated below (irradiated protons are highlighted in red). (+)-syn-7 gave a characteristic nOe between the pseudo-axial ethereal proton and the axial methyl group. Conversely, (-)-anti-7 gave no measurable nOe for these two groups, as the ethereal proton in this case is in a pseudoequatorial position, placing it on the opposite side of the ring from the axial methyl group.

Quantitative determination of stereoretention was accomplished via achiral GC analysis. Hydrogenation of the Grignard addition product gave compound S4 as a mixture of diastereomers, which was used as a standard to establish a baseline separation of the
diastereomers by GC. The corresponding diastereomerically enriched (-)-anti-S4 or (+)-anti-S4 were subjected to GC analysis to establish the initial diastereomeric ratio of the starting material that would be subjected to the $[\mathrm{FePc}] \mathrm{SbF}_{6}$-catalyzed $\mathrm{C}-\mathrm{H}$ amination reaction. The diastereomeric mixture of (+)-syn-7 and (-)-anti-7, prepared by the synthetic pathway illustrated above, was used as a standard to establish a baseline separation of the oxathiazinane diastereomers by GC. Following standard work-up protocol for the [FePc] $\mathrm{SbF}_{6}$-catalyzed $\mathrm{C}-\mathrm{H}$ amination reaction, the crude reaction mixture was subjected to GC analysis in triplicate runs using the optimized method established by the standard mixture. The stereoretention under the reaction was then determined by comparing the diastereomeric ratio of the starting material with that of oxathiazinane product 7. No loss of d.r. suggests that the purported carbon-centered radical intermediate has a lifetime shorter than $1 \times 10^{-9} \mathrm{~s}$, whereas a change in d.r. would indicate that the radical is sufficiently long-lived to at least partially racemize a stereodefined tertiary center.

A 10 mL round bottom flask equipped with a stir bar and rubber septum was charged with sulfamate ester ( $0.400 \mathrm{mmol}, 1.0$ equiv), $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.6 \mathrm{~mL}, 0.15 \mathrm{M})$, magnesium oxide ( 37.1 mg , $0.920 \mathrm{mmol}, 2.3$ equiv), $\mathrm{PhI}(\mathrm{OAc})_{2}\left(142 \mathrm{mg}, 0.440 \mathrm{mmol}, 1.1\right.$ equiv), and $\mathrm{Rh}_{2}(\mathrm{OAc})_{4}(3.5 \mathrm{mg}$, $0.008 \mathrm{mmol}, 0.02$ equiv) sequentially (if sulfamate ester is an oil, it was taken up in solvent and added to the flask via syringe). The reaction stirred at room temp for 4 h . Upon completion, the mint green reaction mixture was filtered through a small pad of $\mathrm{MgSO}_{4}$ over Celite and rinsed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Upon removal of solvent under reduced pressure, flash column chromatography on silica allowed separate isolation of each component.

Method for KIE Determination: The column-purified product mixture 19 (35-40 mg in $700 \mu \mathrm{~L}$ $\mathrm{CDCl}_{3}$, in a straight-walled NMR tube) was analyzed by ${ }^{13} \mathrm{C}-\mathrm{NMR}$. ${ }^{8,10}$ In order to obtain an accurately integratable ${ }^{13} \mathrm{C}-\mathrm{NMR}$, the experiment was run under inverse-gated decoupling conditions (decoupling switched off during the relaxation delay; for Varian, the command is $d m=$ 'nny'). A delay of 5 s was used, with sufficient scans to obtain a signal-to-noise ( $\mathrm{S} / \mathrm{N}$ ) ratio of $>30: 1$ on the deuterated peak. The KIE was reported as the area of the deuterated peak over that of the protonated peak. Three identical experiments were run and an average value was calculated with measurement error.
Alternative Method: $15 \mathrm{mg} \mathrm{Cr}(\mathrm{acac})_{3}$ was added to the NMR sample; this additive significantly reduces relaxation time for ${ }^{13} \mathrm{C}$-NMR and allows for more accurate integration than inverse-gated decoupling alone. ${ }^{11}$ Experimental conditions were otherwise identical to the standard method. It was found that for both the Rh - and Fe-catalyzed $\mathrm{C}-\mathrm{H}$ amination reactions, the calculated KIEs were noticeably higher, although the trend remains the same. The following KIEs were determined: Rh conditions $-3.5 \pm 0.4$ (3.7, 3.7, 3.1); Fe conditions - $4.8 \pm 0.3$ (4.7, 5.1, 4.7).

This compound was prepared according to the methods described in the literature. ${ }^{16}$ The initial product was isolated as a $1: 1$ anti:syn mixture of diastereomers following flash column chromatography on silica using 9:1 hexanes/EtOAc as eluent. It was diastereomerically enriched via MPLC purification with a 240 g basic alumina column (Activity II-III) using neat $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ as eluent (the order of elution was the anti diastereomer first, then syn). After 4-6 iterations in which fractions containing only one diastereomer were removed each time, the pure products were isolated as a $>20: 1$ mixture (as determined by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis). This compound has been previously reported in the literature as a diastereomeric mixture. ${ }^{16}$

## 6,10-dimethylundecan-4-ol [S4].

6,10-dimethylundeca-1,9-dien-4-ol (1.0 equiv) was dissolved in MeOH ( 0.1 M ) in a flask equipped with a stir bar. Activated $30 \% \mathrm{Pd} / \mathrm{C}(10 \mathrm{mg}$ per mmol of substrate) was added, and then the flask was sealed with a rubber septum. A balloon of $\mathrm{H}_{2}$ was placed over the flask, and $\mathrm{H}_{2}$ was bubbled through the reaction mixture with stirring until complete disappearance of olefins was observed, as monitored by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis. Upon completion, the reaction mixture was filtered through a short silica plug, which was washed with additional MeOH . The filtrate was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. No further purification was necessary.

The mixture stirred for 15 min at $0^{\circ} \mathrm{C}$, then 30 min at rt before cooling back to $0^{\circ} \mathrm{C}$ and adding ester.
