I. General Information:

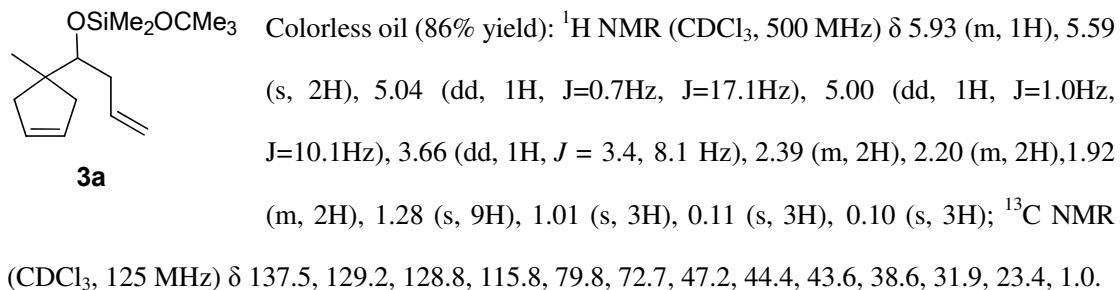

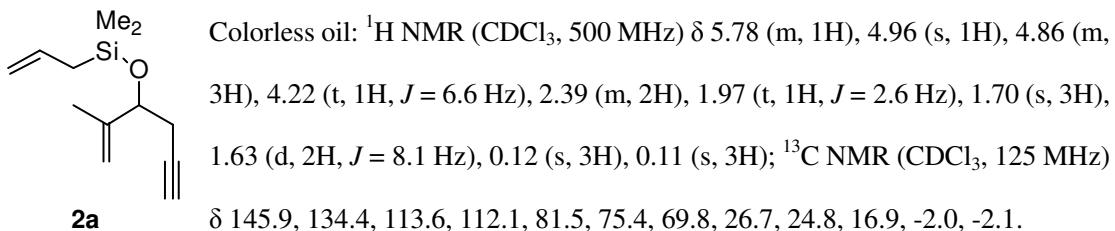

Reactions were carried out in vials or glassware under air. Compounds were purchased from Aldrich or Acros or TCI America unless otherwise noted. Dichloromethane (DCM) was distilled from calcium hydride (CaH_2) under nitrogen atmosphere. Flash chromatography was performed using silica gel 60 Å (32–63 mesh) purchased from Silicycle Inc. Analytical thin layer chromatography (TLC) was performed on 0.25 mm E. Merck precoated silica gel 60 (particle size 0.040–0.063 mm). Yields refer to chromatographically and spectroscopically pure compounds unless otherwise stated. ^1H NMR and ^{13}C NMR spectra were recorded on a Bruker DRX-500 spectrometer. Multiplicities are indicated by s (singlet), d (doublet), t (triplet), q (quartet), qn (quintet), sext (sextet), m (multiplet), b (broad), and app (apparent). ^1H NMR signals that fall within a ca. 0.3 ppm range are generally reported as a multiplet, with a single chemical shift value corresponding to the center of the peak. Coupling constants, J , are reported in Hz (Hertz). Electron impact (EI) mass spectra and Chemical Ionization (CI) mass spectra were obtained using a Micromass 70-VSE in the University of Illinois at Urbana-Champaign. IR spectra were recorded using JASCO FT-IR-4100 with GLADiATRTM Attenuated Total Reflectance (ATR) FT-IR accessory.

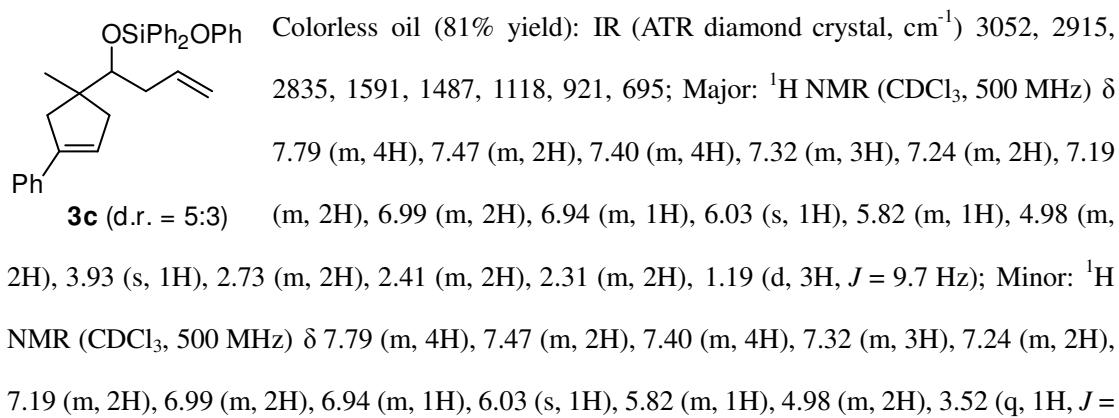

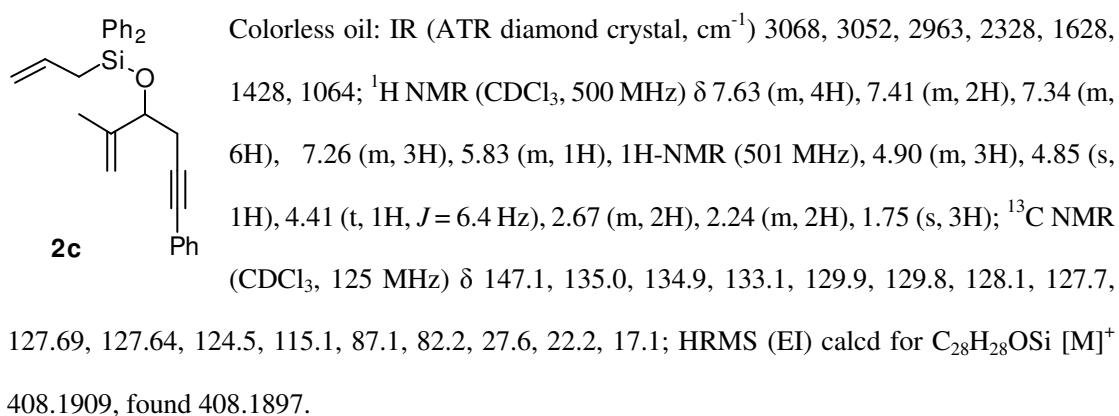

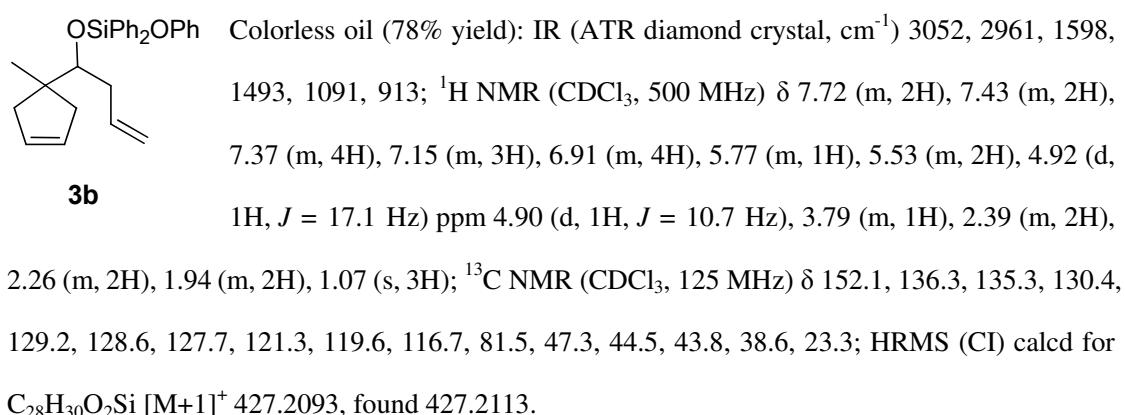

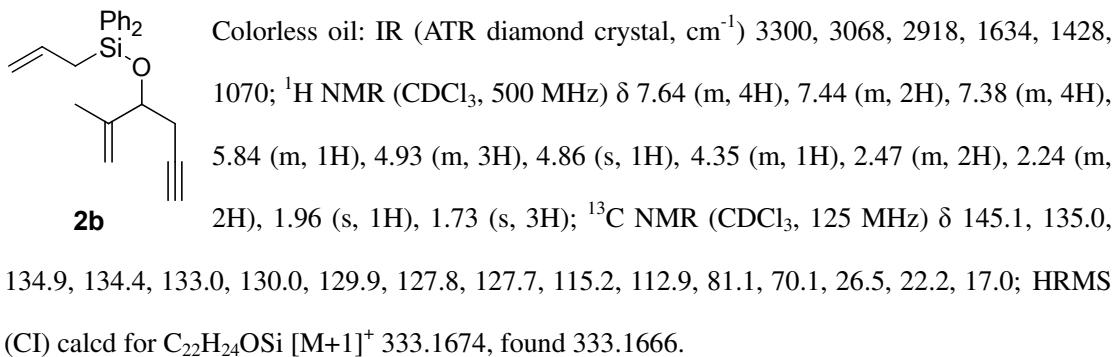

II. Procedure for Au(I)-catalyzed reaction with intramolecular allylation

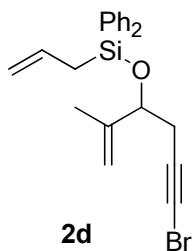

To a solution of 3-allylsilyloxy-1,5-alkyne **2b** (60.1 mg, 0.18 mmol) and phenol (18.8 mg, 0.20 mmol) in CH_2Cl_2 (0.5 mL) was added the Au(I) catalyst **1** (1 mol%). The resulting solution was stirred at room temperature for 1 hour, at which point TLC indicated the consumption of the starting material. The reaction mixture was concentrated to afford the crude product, which was purified by column chromatography with hexane and ethyl acetate (30:1) to give the desired cyclopentene product **3b** (colorless oil, 73.7 mg, 96% yield).
