SUPPLEMENTAL METHODS

Live cell microscopy

Colocalization analyses- Colocalization analysis of raw data image stacks was performed using MetaMorph (Correlation Plot plugin). The correlation coefficient (r) measures the correlation between intensities of corresponding pixels in two images (the red and green channels). The correlation coefficient calculation can return a range of values from -1.0 to +1.0 where a value of +1.0 shows the data are perfectly correlated and a value of -1.0 shows an inverse relationship of the pixel values between the two images.

SUPPLEMENTAL TABLES

A. Chlorpromazine inhibits THIO-QD and cell membrane association at concentrations as high as 250 nM.

THIO-QD concentration (nM)	% Fluorescent cells	
	- Chlorpromazine	+ Chlorpromazine
0	1.0 ± 0.2	1.4 ± 0.3
31.2	65.6 ± 2.4	2.8 ± 0.5
62.5	85.1 ± 1.6	9.9 ± 1.4
125	91.5 ± 1.5	26.8 ± 3.6
250	93.6 ± 1.3	34.9 ± 2.1

B. MPA-QDs utilize scavenger receptors as a mechanisms for cellular entry at low concentrations, while THIO-QDs do not.
