Supporting Information

1. General experimental methods (S2).
2. General experimental procedure and characterization data (S2-S9).
3. ¹H and ¹³C NMR spectra of compound 3 (S10-S39).

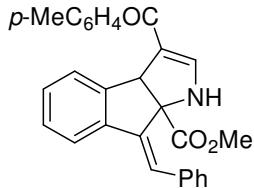

General experimental methods:

All reactions were performed in reaction tubes under air atmosphere. Flash column chromatography was performed using silica gel (60-Å pore size, 32–63 µm, standard grade). Analytical thin-layer chromatography was performed using glass plates pre-coated with 0.25 mm 230–400 mesh silica gel impregnated with a fluorescent indicator (254 nm). Thin layer chromatography plates were visualized by exposure to ultraviolet light. Organic solutions were concentrated on rotary evaporators at ~20 Torr (house vacuum) at 25–35°C. Commercial reagents and solvents were used as received. Nuclear magnetic resonance (NMR) spectra are recorded in parts per million from internal tetramethylsilane on the δ scale.

*General procedure for the base-promoted cascade reaction of (E)-2-alkynylphenylchalcone **1** with 2-isocyanoacetate **2**.*

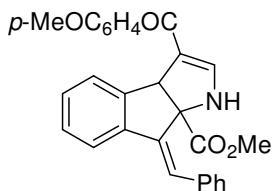

2-Isocyanoacetate **2** (0.24 mmol, 1.2 equiv) and DBU (0.2 mmol, 1.0 equiv) were added to a solution of (E)-2-alkynylphenylchalcone **1** (0.20 mmol) in CH₃CN (1.0 mL). The mixture was stirred at 80 °C for 3~5 hours. After completion of reaction as indicated by TLC, the mixture was purified directly by flash column chromatograph (EtOAc/n-hexane, 1:3) to give the desired product **3**.
