## General Experimental Details

All reactions were performed under a nitrogen atmosphere in oven-dried apparatus, unless otherwise stated. Anhydrous acetonitrile, dichloromethane and tetrahydrofuran were obtained from an Innovative Technology Inc. PS-400-7 solvent purification system. Petrol refers to the fraction of petroleum ether boiling at $40-60^{\circ} \mathrm{C}$. All other commercially available compounds were used as obtained from the chemical suppliers. Analytical thin layer chromatography was performed using commercially available aluminium backed plates coated with Merck G/UV254 neutral silica. Plates were visualised under UV light (at 254 nm ) or by staining with phosphomolybdic acid followed by heating. Flash chromatography was performed using chromatography grade, silica 60 Å particle size 35-70 microns from Fisher Scientific. ${ }^{1} \mathrm{H}$ NMR spectra were recorded at 300 MHz and ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ spectra were recorded at 75 MHz on a Brüker Avance 300 spectrometer. Chemical shifts, $\delta$, are quoted in parts per million and are referenced to the residual solvent peak. The following abbreviations are used: $s$, singlet; $d$, doublet; t , triplet; q , quartet; dd, doublet of doublets; dt , doublet of triplets; m, multiplet; app., apparent and br., broad.. Coupling constants, J, are quoted to the nearest 0.5 Hz . High resolution mass spectra were recorded on a Brüker Daltonics microTOF spectrometer with an electrospray source and external calibration. Masses were recorded in positive electrospray ionisation mode and were introduced by flow injection. Masses are accurate to 5 ppm and data was processed using DataAnalysis software from

Brüker Daltonics. Infrared spectra were recorded on a Perkin Elmer Spectrum 100 FT-IR spectrometer, using a Universal ATR accessory for sampling, with only selected absorbances quoted as $v$ in $\mathrm{cm}^{-1}$.

## General Procedures

## General Procedure 1: Acetal Formation ${ }^{1}$

To a stirred substituted 2-bromobenzadehyde ( 1.0 equiv.) in toluene ( 50 mL ), 1,3propanediol ( 1.5 equiv.) and $p$-toluene sulphonic acid (PTSA) ( 0.1 equiv.) were added and the solution was heated at reflux under Dean-Stark conditions for 3 hours. After cooling to room temperature, the reaction mixture was washed with water, the organic extract dried using $\mathrm{MgSO}_{4}$ and the solvent evaporated under reduced pressure. The crude compounds were purified by recrystallisation using a suitable solvent system.

## General Procedure 2: Heck Reaction on Protected 2-Bromobenzaldehydes ${ }^{2}$

To a solution of substituted 2-(2-bromophenyl)-1,3-dioxolan (1.0 equiv.) in acetonitrile, palladium(II) acetate ( 0.05 equiv.) and tri(o-tolyl)phosphine ( 0.10 equiv.) were added. Diisopropylethylamine ( 3.0 equiv.) and the appropriate acrylate ( 1.0 equiv.) were added and the mixture was heated at reflux for 24 hours. After cooling to room temperature, the reaction was diluted with water ( 50 mL ) and the aqueous layer extracted with toluene ( 2 x $50 \mathrm{~mL})$. The combined organic extracts were combined and washed with water ( $2 \times 50 \mathrm{~mL}$ ) and brine ( 30 mL ) then dried over $\mathrm{MgSO}_{4}$. The mixture was filtered through a plug of Celite ${ }^{\circledR}$ and then the solvent removed under reduced pressure. Crude compounds were purified by flash column chromatography.

## General Procedure 3: Chemoselective Conjugate Reduction of Esters ${ }^{3}$

Substituted ethyl 3-(2-(1,3-dioxan-2-yl)phenyl)propanoates (2.0 equiv.) were stirred in ethanol ( 10 mL ) for 30 minutes prior to the addition of cobalt(II) chloride hexahydrate ( 0.02 equiv.). The solution was then cooled to $0{ }^{\circ} \mathrm{C}$ and sodium borohydride ( 4.0 equiv.) was added. The solution was then allowed to warm to room temperature and stirred for up to 48 hours. The reaction was then quenched with water ( 50 mL ) and diluted with ethyl acetate ( 30 mL ). The organic layer was separated, washed with brine ( 50 mL ), dried with
$\mathrm{MgSO}_{4}$ and the solvent evaporated under reduced pressure. Crude compounds were purified by flash column chromatography.

## General Procedure 4: Acetal Deprotection

Substituted ethyl-3-(2-formylphenyl)propanoates were added to a solution of acetic acid: water ( $7 \mathrm{~mL}: 3 \mathrm{~mL}$ ) and left to stir open to the air overnight. The residue was partioned between water $(50 \mathrm{~mL})$ and diethyl ether $(50 \mathrm{~mL})$. The aqueous layer was extracted with diethyl ether ( $2 \times 30 \mathrm{~mL}$ ) and the organic layers combined and washed with a saturated solution of $\mathrm{NaHCO}_{3}(2 \times 30 \mathrm{~mL})$ and brine ( 30 mL ). The organics are then dried using $\mathrm{MgSO}_{4}$ and filtered before being evaporated under reduced pressure to yield pure products.

## General Procedure 5: Imine-Enolate Cyclisation Reaction for 1a-g

Substituted $\quad(S, E)$-ethyl-3-(2-((1-(4-methoxyphenyl)ethylimino)methyl)phenyl)propanoates (1.0 equiv.) were dissolved in THF. 15-Crown-5 (1.1 equiv.) and NaHMDS (1.1 equiv.) were added and the mixture was left stirring for 8 hours at $-40^{\circ} \mathrm{C}$. The reaction was quenched with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(10 \mathrm{~mL})$. The aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \mathrm{x}$ 30 mL ) and the organic layers were combined and washed with water ( 50 mL ). The organics were then dried using $\mathrm{MgSO}_{4}$ and filtered before being evaporated under reduced pressure. Crude compounds were purified by flash column chromatography.

## Acetals

## 2-(2-Bromophenyl)-1,3-dioxane

The title compound was prepared according to General Procedure 1 from 2bromobenzadehyde ( $10.0 \mathrm{~g}, 54 \mathrm{mmol}$ ), 1,3-propanediol ( $6.16 \mathrm{~g}, 81 \mathrm{mmol}$ ) and PTSA ( 0.86 g , $5 \mathrm{mmol})$. The crude was purified by recrystallisation from diethyl ether, yielding a white solid (10.47 g, 80\%).

## Ethyl 4-(2-formylphenyl)butanoate

To a Schlenk flask flushed with nitrogen, anhydrous $\mathrm{LiCl}(0.75 \mathrm{~g}, 17.6 \mathrm{mmol})$ was added dried under vacuum. Zinc dust ( $1.15 \mathrm{~g}, 17.6 \mathrm{mmol}$ ) was added and the resultant mixture was further dried under high vacuum. THF ( 10 mL ) was added and left to stir for 10 mins. To the suspension, dibromoethane ( $0.076 \mathrm{~mL}, 0.58 \mathrm{mmol}$ ), $\mathrm{Me}_{3} \mathrm{SiCl}$ ( $0.015 \mathrm{~mL}, 0.12 \mathrm{mmol}$ ), iodine $(0.09 \mathrm{~g}, 0.35 \mathrm{mmol})$ and ethyl 4-bromobutyrate ( $1.68 \mathrm{~mL}, 11.8 \mathrm{mmol}$ ) were added and the solution was stirred for 12 hrs at $50^{\circ} \mathrm{C}$. The resultant grey suspension was cooled to room temperature and 2-bromobenzaldehyde ( $1.10 \mathrm{~mL}, 9.4 \mathrm{mmol}$ ), PEPPSI ( $0.04 \mathrm{~g}, 0.06 \mathrm{mmol}$ ) and DMI ( 5 mL ) were added to the solution which was left to stir at room temperature for

12 hrs . The reaction was quenched with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(20 \mathrm{~mL})$ and then filtered through cotton wool. The aqueous layer was extracted with diethyl ether ( $2 \times 10$ mL ). The combined organics were collected, washed with brine ( $2 \times 10 \mathrm{~mL}$ ) and dried over $\mathrm{MgSO}_{4}$. The solution was then filtered and the solvent evaporated under reduced pressure. ${ }^{4}$ The crude compound was purified using flash column chromatography [Petrol : EtOAc, 90:10, $\mathrm{R}_{f}-0.50$ ] yielding a yellow oil ( $0.90 \mathrm{~g}, 51 \%$ ).
