Supporting Information Available: The list of Abbreviations, syntheses of mesoporous silicas, results of physical measurements (ICP-MS, nitrogen adsorption isotherms, XRD spectra and EPR spectra) and $\mathrm{IC}_{50}$ values of mimic materials.

## Abbreviation

| CuIm CZS | Equivalent mixture of $\mathrm{Cu}\left(\mathrm{ClO}_{4}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and imidazolate anion (diethylenetriamine) $\mathrm{Cu}-\mu$-imidazolate- Zn (tris(2-aminoethyl)amine) perchlorate or $[(\mathrm{N} 3) \mathrm{Cu}-\mu-\mathrm{Im}-\mathrm{Zn}(\mathrm{N} 4)]\left(\mathrm{ClO}_{4}\right)_{3} \cdot \mathrm{CH}_{3} \mathrm{OH}$ |
| :---: | :---: |
| CuZnSOD | Copper zinc superoxide dismutase |
| Im | Imidazole |
| MPS | Mesoporou silica |
| MSN-N3 | N3(diethylenetriamine) silanol group supported on MSN |
| MSN-N3-CuIm | CuIm immobilized on MSN-N3 covalently |
| MSN-CZS-c | $\mathrm{ZnN4}$ binding to MSN-CuIm covalently |
| MSN-CZS-1 ${ }_{\text {sol }}$ | Cu (II) and Zn (II) residue in MeOH after MSN loading CZS complex via ionic exchange |
| N3 | Diethlenetriamine |
| N4 | Tris(2-aminoethyl)amine |
| NBT | Nitro blue tetrazolium |
| $\mathrm{O}_{2}{ }^{-}$ | Superoxide anion radicals |
| SBA-15-CuIm | CuIm immobilized on SBA-15-N3 covalently |
| SBA-15-CZS-c | ZnN 4 binding to SBA-15-CuIm covalently |
| SBA-15-CZS- $\mathrm{i}_{\text {sol }}$ | SBA-15 loading with CZS complex via ionic exchange in solution |
| TMAC | N-trimethoxysilylpropyl-N,N,N-trimethyl-ammonium chloride |
| X-CZS-i | CZS immobilized in X mesoporous silica, such as MSN, SBA-15, MCM-41-SH, Al-MCM-41 and Al-SBA-15 via ionic exchange |

## Experimental Section: Syntheses of Mesoporous Silicas.

Synthesis of MSN. MSN is nano-sized MCM-41. The size range of MSN could be between 30
to $300 \mathrm{~nm} .{ }^{1}$ It suspended in water very well and can be used as nanocarrier. The protocol of preparation was given previously. ${ }^{2}$ Briefly, we synthesized MSN under low concentration of tetraethoxysilane (TEOS), surfactant and $\mathrm{NH}_{4} \mathrm{OH}$ as base in a two-step preparation process. First,
0.58 g of cetyltrimethyl-ammonium bromide $\left(\mathrm{C}_{16} \mathrm{TAB}\right)$ was dissolved in 300 g of 0.51 M $\mathrm{NH}_{4} \mathrm{OH}$ at $50{ }^{\circ} \mathrm{C}$, and 5 mL of 0.21 M dilute TEOS (in ethanol) was added. After stirring for 5 h , 5 mL of 0.88 M TEOS was added, followed by stirring for another 1 h . The solution was then aged at $50{ }^{\circ} \mathrm{C}$ for 24 h . Precipitate were separated by centrifuging at 18000 rpm for 20 min , washing, and re-dispersing with ethanol several times. Surfactant templates were removed by extraction in acidic ethanol ( 1 g of $\mathrm{HCl} / 50 \mathrm{~mL}$ of ethanol at reflux temperature for 24 h ) and solids was re-dispersed in ethanol.

Synthesis of particulate SBA-15 and AI-SBA-15. A typical synthesis procedure using the triblock copolymer Pluronic P-123 as template was given previously. ${ }^{3}$ Briefly, we summarize as follows: 1.4 g of $\mathrm{P}-123$ was first dissolved in 50 mL deionized water at $45^{\circ} \mathrm{C}$. Second, 5.5 g sodium silicate solution $\left(27 \% \mathrm{SiO}_{2}\right)$ was adjusted to a pH value of 5.0 by titration with 1.2 M sulfuric acid under stirring at $45^{\circ} \mathrm{C}$. Then two solutions were mixed and aged for 3 h . After the gel was hydrothermally treated at $100^{\circ} \mathrm{C}$ for 24 h in a static autoclave, the mixture was filtered, washed with deionized water and calcined at $560{ }^{\circ} \mathrm{C}$ in air for 6 h . The Al-SBA- 15 was synthesized by adding sodium aluminate $\left(54 \% \mathrm{Al}_{2} \mathrm{O}_{3}\right)$ to the solution of $\mathrm{P}-123$ in the first step as mentioned above. The molar composition was (37) $\mathrm{SiO}_{2}$ : (1) $\mathrm{Al}_{2} \mathrm{O}_{3}$.

Synthesis of particulate Al-MCM-41-N ${ }^{+}$. First, a proper amount of 1.2 M sulfuric acid was added to sodium silicate solution $\left(27 \% \mathrm{SiO}_{2}\right)$ to adjust its pH value to 9 . The solution was added
to a $\mathrm{C}_{16} \mathrm{TAB}$ solution with sodium aluminate $\left(54 \% \mathrm{Al}_{2} \mathrm{O}_{3}\right)$ under stirring at $45{ }^{\circ} \mathrm{C}$ and a gel mixture was formed. The molar composition was (37) $\mathrm{SiO}_{2}$ : (1) $\mathrm{Al}_{2} \mathrm{O}_{3}$. Aged for 3 h , the gel was then hydrothermally treated at $100{ }^{\circ} \mathrm{C}$ for 24 h in a static autoclave. The as-synthesized product was filtered and washed thoroughly with deionized water. Then the dried product was calcined at $560^{\circ} \mathrm{C}$ in air for 6 h to remove the organic templates. ${ }^{4}$

The positive charged Al-MCM-41- $\mathrm{N}^{+}$was synthesized as follows: 0.0156 mL of N-trimethoxysilylpropyl-N,N,N-trimethylammonium chloride (TMAC) was added to 0.3 g of Al-MCM-41 with 20 mL ethanol and stirred at reflux temperature for 24 h . The solids were separated by filtration, washing, and re-dispersing with ethanol several times to remove the TMAC residues.

Synthesis of MCM-41-SH. The materials MCM-41-SH provides stronger surface acidity because its silicon source is beta-zeolite seed. ${ }^{5,6}$ It was synthesized with short surfactant (myristyltrimethylammonium bromide $\left(\mathrm{C}_{14} \mathrm{TAB}\right)$ ) as template, and put small quaternary ammonium ions (TEAOH) together in order to separately develop a zeolitic nanocluster as the silica precursor. Originally, sodium aluminate, sodium hydroxide, and tetraethylammonium hydroxide ( $20 \% \mathrm{wt} \%$ aqueous solution) were put together in a vessel. The fumed silica source was added to the mixture and stirred for 4 h . Then, the solution was transferred to autoclave and hydrothermal at $100{ }^{\circ} \mathrm{C}$ for 18 h to yield zeolite precursors. $\mathrm{C}_{14} \mathrm{TAB}$ was dissolved in deionized
water followed by adding zeolite precursors, and transferred to autoclave to be treated hydrothermally at $120^{\circ} \mathrm{C}$ for about 48 h . Then, the solution was cooled to room temperature and adjusted pH to 10 . The resulting mixture was hydrothermally treated again at $120{ }^{\circ} \mathrm{C}$ for 48 h . Finally, the solid sample was filtered, washed with deionized water and calcined at $580{ }^{\circ} \mathrm{C}$ for 3 $h$ to remove $\mathrm{C}_{14} \mathrm{TAB}$. The molar ratio was (37) $\mathrm{SiO}_{2}$ : (1) $\mathrm{Al}_{2} \mathrm{O}_{3}$.
