^{a)}Refer to membrane enriched (M) and total (T) protein fractions

^{b)}Positive values indicates protein up-regulation with the fold-change calculated using the ratio SA-treated/non-treated samples. Negative values indicate protein down-regulation with fold-change calculated using the ratio non- treated/SA-treated samples. de novo: protein spot detected on SA-treated samples only; ND: protein spot detected on non-treated samples only

^{c)}The minimum score value considered for protein identification through MASCOT was 58
