Title: A Kinetic Approach for Investigating the "Microwave Effect":Decomposition of Aqueous Potassium Persulfate

Authors: Başak Temur Ergan, Mahmut Bayramoğlu

## Calibration Procedure of the Microwave Power Output:

According to the standard method (IEC/EN 60705) ${ }^{37}$, empty flask (pyrex) container was weighed, filled with 1000 g of distilled water at the initial temperature of $10 \pm 0.5^{\circ} \mathrm{C}$, and placed into the microwave (MW) reactor cavity. MW energy was supplied at 1000W. The water was stirred along the heating period by a magnetic stirrer at 160 rpm . After 60s, the final temperature of water load was measured by both FO and IR sensors. The energy balance is given by Eq. (1) $)^{38,39}$ in this section:

$$
\begin{equation*}
P=\frac{c_{p w} \cdot m_{w}\left(T_{2}-T_{1}\right)+c_{p c} \cdot m_{c}\left(T_{2}-T_{1}\right)+c_{p m} \cdot m_{m}\left(T_{2}-T_{1}\right)}{t} \tag{1}
\end{equation*}
$$

Where; $P$ : test power $(\mathrm{W}), m_{w}$ : mass of water $(\mathrm{g}), c_{p w}$ : specific heat capacity of water $=$ $4.187 \mathrm{Jg}^{-1 \mathrm{o}} \mathrm{C}^{-1}, m_{c}$ : mass of container $(\mathrm{g}), c_{p c}$ : specific heat capacity of container $=0.750 \mathrm{Jg}^{-}$ ${ }^{1{ }^{\circ}} \mathrm{C}^{-1}, m_{m}$ : mass of magnet $(\mathrm{g}), c_{p m}$ : specific heat capacity of magnet $=0.465 \mathrm{Jg}^{-1}{ }^{\circ} \mathrm{C}^{-1}, t$ : heating time $=60 \mathrm{~s} T_{1}$ : initial temperature of water $\left(10 \pm 0.5^{\circ} \mathrm{C}\right), T_{2}$ : final temperature of water.

The power test was further performed with a set of flasks of volume between $100 \mathrm{~cm}^{3}$ and $1000 \mathrm{~cm}^{3}$. Following the same procedure, a known amount of water at the initial temperature of $10 \pm 0.5^{\circ} \mathrm{C}$ was placed into the cavity and MW energy was supplied for 60 s . The applied nominal power $\left(P_{\text {nom }}\right)$, was chosen so that the final temperature of the water load was near the ambient temperature to minimize heat losses and to apply Eq.(1) without any heat losses term
for the calculation of the test power $P$. The load curve ${ }^{38-39}$ presenting the test power as a function of load size for flask containers is shown in supp.info.Figure 1. To account for the differences between the absorbed and nominal power values, a correction factor is defined as

$$
\begin{equation*}
\mathrm{p}=P / P_{\mathrm{nom}} \tag{2}
\end{equation*}
$$

Figure 1. Load curve for flask containers

Average $P_{\text {nom }}$ of each run was calculated as follows; the initial two minutes was not taken into account in the calculations by considering the transient state of the system to reach the steady state of constant temperature and MW power. From this point, local $P_{\text {nom }}$ values recorded at one second time intervals until the end of the experiment were arithmetically averaged to obtain an initial estimate. Then, a statistical test was performed to detect outliers (high or low $P_{\text {nom }}$ values due to uncontrolled disturbances) by considering their deviation from the mean value. These were removed from the data and the arithmetic mean value was recalculated as the final average $P_{\text {nom }}$. This was multiplied by p value ( 0.768 for our experimental system) to finally obtain $P$.

## Calibration Procedure of UV:

For calibration of UV, aqueous solutions of $\mathrm{K}_{2} \mathrm{SO}_{4}$ and $\mathrm{K}_{2} \mathrm{~S}_{2} \mathrm{O}_{8}$ of various concentrations were scanned between 190 and 260 nm using a UV-Vis spectrophotometer (Perkin-Elmer, Lamda-35), as shown in supp.info.Figure 2. Calibration curves were drawn at different wavelengths, as shown in supp.info.Figure 3 . The highest correlation $\left(R^{2}=0.9994\right)$ was obtained with wavelength of 215 nm and molar absorptivities at this wavelength were calculated as $\varepsilon_{1}=0.3019 \mathrm{mM}^{-1} \mathrm{~cm}^{-1}$ for $\mathrm{K}_{2} \mathrm{~S}_{2} \mathrm{O}_{8}$ and $\varepsilon_{2}=0.0030 \mathrm{mM}^{-1} \mathrm{~cm}^{-1}$ for $\mathrm{K}_{2} \mathrm{SO}_{4}$ (shown in Supp. Info. Table 1). During the runs, the absorbance was measured at intervals of 6 seconds (in order to minimize random fluctuations in absorbance values), and approximately 200 absorbance-time data points were recorded. A typical experimental plot at 215 nm is shown in supp.info. Figure 4.

Figure 2. UV spectra of $\mathrm{K}_{2} \mathrm{~S}_{2} \mathrm{O}_{8}(4 \mathrm{mM})$ and $\mathrm{K}_{2} \mathrm{SO}_{4}(8 \mathrm{mM})$ between $190-260 \mathrm{~nm}$

Figure 3. Calibration curves of $\mathrm{K}_{2} \mathrm{~S}_{2} \mathrm{O}_{8}$ between $190-260 \mathrm{~nm}$

Supp. Info. Table 1. Molar absorptivities of $\mathrm{K}_{2} \mathrm{~S}_{2} \mathrm{O}_{8}$ and $\mathrm{K}_{2} \mathrm{SO}_{4}$ between 190 and 260 nm .
