## Experimental

Elemental analyses were conducted using an Exeter CE-440 Elemental Analyzer. 200 MHz ${ }^{1} \mathrm{H}$ and $75 \mathrm{MHz}{ }^{13} \mathrm{C}$ (Varian) spectra were obtained at room temperature in $\mathrm{CDCl}_{3}$. MS data were collected by directly infusing solutions of each compound into a ThermoFinnigan Model LCQ MS equipped with an ESI source. Anthracenone 1 was synthesized by a previously reported procedure. ${ }^{8}$ 3-thiophenacetonitrile, $2,2^{\prime}$-bithiophene, $2,2^{\prime}, 5^{\prime}, 2^{\prime \prime}$ terthiophene, and N-(2-cyanoethyl)-pyrrole were purchased from Aldrich and used without further purification. Melting points were determined in an open capillary and are uncorrected. Low solubility in $\mathrm{CDCl}_{3}$ and high signal to noise ratio for 4-6 restricted observation of ${ }^{13} \mathrm{C}$ resonances for carbons with no hydrogen atoms attached.

2-(3-thiopheneacetonitrile)-9-(1,8-oxybis(ethyleneoxyethyleneoxy)anthracence-10-one (2): 1.00 gram ( 0.92 mmol ) of 3-thiopheneacetonitrile was stirred with 0.085 gram ( 0.21 mmol ) of $\mathbf{1}$ and warmed to get a clear solution. 3 drops of $70 \%$ perchloric acid were added and stirred for 4 hrs. The precipitate was filtered and washed with 5 mL of diethyl ether and air-
dried. The entire crude product was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{CH}_{3} \mathrm{OH}$ (80:20) and diffused with diethyl ether. A yellow crystalline solid was obtained. Yield: $40 \%$. Melting point $=223-$ $226{ }^{\circ} \mathrm{C}$. Elemental Analyses calculated for $\mathrm{C}_{28} \mathrm{H}_{26} \mathrm{O}_{6} \mathrm{NS}: \mathrm{C}, 66.52 ; \mathrm{H}, 5.38, \mathrm{~N}, 2.77 \%$; Found: C, $65.90 ; \mathrm{H}, 5.14 ; \mathrm{N}, 2.88 \% .{ }^{1} \mathrm{H}$ NMR ( $\left.\left[\mathrm{CD}_{3}\right]_{2} \mathrm{CO}, 25^{\circ} \mathrm{C}\right): \delta 3.77-4.32(\mathrm{~m}, 16 \mathrm{H}$, $\left.\mathrm{CH}_{2}-\mathrm{O}\right) ; 4.58\left(s, 2 \mathrm{H}, \mathrm{CH}_{2}-\mathrm{CN}\right) ; 6.34(s, 1 \mathrm{H}$, methine); 7.12 ( $d, 1 \mathrm{H}$, thiophene); $7.25(d, 2 \mathrm{H}$, anthracenone); $7.42(t, 2 \mathrm{H}$, anthracenone); $7.52(d, 1 \mathrm{H}$, thiophene); $7.79(d, 2 \mathrm{H}$, anthracenone).

5-(2,2'-bithiophene)-9-(1,8-oxybis(ethyleneoxyethyleneoxy)anthracence-10-one (3): 0.2 g ( 0.5 mmol ) of 1 and $0.0913 \mathrm{~g}(0.55 \mathrm{mmol})$ of 2, ' ${ }^{\prime}$-bithiophene were mixed with 5 ml of benzonitrile. The solution was stirred for 15 minutes and 5 drops of sulfuric acid were added. The addition of sulfuric acid turned the solution light blue-green with continued stirring for 30 minutes. The benzonitrile solution was mixed with an excess ( 100 mL ) of diethyl ether to precipitate the product. A cream-colored solid was obtained which was filtered off, washed with diethyl ether and air dried. Yield: $\sim 40 \%$. Melting point $=270-275$ ${ }^{\circ} \mathrm{C}$. X-ray quality crystals were grown from $\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{CH}_{3} \mathrm{OH}$ mixture (4:1) and diffused with diethyl ether. Crystallographic data were collected at 100 K using $\mathrm{MoK}_{\alpha}$ radiation on a Bruker CCD APEXII diffractometer. Cell constants were determined after integration from typically more than 9,000 reflections. ${ }^{12}$ Structures were solved by direct methods using SIR $97{ }^{13}$ and refined using SHELXL-97. ${ }^{14}$ Data reduction and refinement were completed using the WinGX suite of crystallographic software. ${ }^{15}$ All hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. For 6, the terminal thiophene group is also disordered over two positions in a 2:1 ratio and both positions were refined isotropically. The larger occupancy has the thiophene sulfur atom (S3) facing away from S1 and S2. DFIX restraints were also applied for the thiophene with the lower occupancy. Table S1 below lists additional crystallographic and refinement information.
