Data collection

A crystal (approximate dimensions 0.40x 0.34 x 0.08mm³) was placed onto the tip of a 0.1 mm diameter glass capillary and mounted on a CCD area detector diffractometer for a data collection at 123(2) K.¹ A preliminary set of cell constants was calculated from reflections harvested from four sets of 30 frames. These initial sets of frames were oriented such that orthogonal wedges of reciprocal space were surveyed. This produced initial orientation matrices determined from 165 reflections. The data collection was carried out using MoK α radiation (graphite monochromator) with a frame time of 45 seconds and a detector distance of 4.8 cm. A randomly oriented region of reciprocal space was surveyed to the extent of one sphere and to a resolution of 0.80 Å. Four major sections of frames were collected with 0.30° steps in ω at four different ϕ settings and a detector position of -28° in 2 θ . The intensity data were corrected for absorption and decay (SADABS).² Final cell constants were calculated from 2997 strong reflections from the actual data collection after integration (SAINT).³ Please refer to Table 1 for additional crystal and refinement information.

Structure solution and refinement

The structure was solved using Bruker SHELXTL⁴ and refined using Bruker SHELXTL.⁴ The space group P2₁/n was determined based on systematic absences and intensity statistics. A direct-methods solution was calculated which provided most non-hydrogen atoms from the E-map. Full-matrix least squares / difference Fourier cycles were performed which located the remaining non-hydrogen atoms. All non-hydrogen atoms were refined with anisotropic displacement parameters. All hydrogen atoms were placed in ideal positions and refined as riding atoms with relative isotropic displacement parameters. The final full matrix least squares refinement converged to $R1 = 0.0387$ and $wR2 = 0.1086$ (F^2 , obs. data).

Structure description

The structure is the one suggested. The molecules form dimers through synergetic hydrogen bonds. It appears these are not disordered since a weak C-H hydrogen bond through H5B forms to O1.

Data collection and structure solution were conducted at the X-Ray Crystallographic Laboratory, 192 Kolthoff Hall, Department of Chemistry, University of Minnesota. All calculations were performed using Pentium computers using the current SHELXTL suite of programs. All publications arising from this report MUST either 1) include Victor G. Young, Jr. as a coauthor or 2) acknowledge Victor G. Young, Jr. and the X-Ray Crystallographic Laboratory.

Some equations of interest:

$$R_{\text{int}} = \Sigma |F_{\text{o}}|^2 - \langle F_{\text{o}}^2 \rangle / \Sigma |F_{\text{o}}|^2$$

$$R_1 = \Sigma |F_{\text{o}}| - |F_{\text{c}}| / \Sigma |F_{\text{o}}|$$

$$wR2 = [\Sigma [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / \Sigma [w(F_{\text{o}}^2)^2]]^{1/2}$$

$$\text{where } w = q / [\sigma^2(F_{\text{o}}^2) + (a*P)^2 + b*P + d + e*\sin(\theta)]$$

$$\text{GooF} = S = [\Sigma [w(F_{\text{o}}^2 - F_{\text{c}}^2)^2] / (n-p)]^{1/2}$$
