General experimental Procedures:

X-ray Crystallography: The diffraction measurements for compounds **10**, **11**, **12**, **13**, **14**, **17**, **20-21**, **23** and **23A** were performed on a Oxford Gemini system and Bruker Apex 2 on graphite-monochromated Mo-K α radiation ($\lambda = 0.7107 \text{ \AA}$). The crystal data for **6**, **22** was collected on a Oxford diffraction X-Calibur diffractometer using Cu radiation ($\lambda = 1.5418 \text{ \AA}$). X-ray diffraction data were obtained on an Oxford XCalibur system using Mo $K\alpha$ radiation ($\lambda = 0.71073 \text{ \AA}$). The structure solutions were achieved by using direct methods as implemented in SHELXS-97.¹ The structures were refined by full least-squares methods using SHELXL-97.²

Computational Details: All geometries were optimized using analytical gradient techniques implemented in the Gaussian03 suite of quantum chemical program.³ Geometry optimization for **11**, **13**, **14** and **15** were performed by B3LYP method with 6-311G(d,p) basis set for H, C, N, O and Lanl2dz(d,p) basis set with corresponding pseudo-potential for Te. Optimized structure of all compounds was confirmed as minima by performing frequency analysis. NBO analyses⁴ on all optimized geometries were performed at B3LYP/Lanl2dz(d,p) (Te), 6-311G(d,p) (H, C, N, O) level. AIM analysis on the optimized geometries of all the compounds were performed by B3LYP method with 6-311G(d,p) basis set for H, C, N, O and WTBS basis set for Te with AIM2000⁵ package.
