7	F ⁻	0.52 ^a	yes	0
7	OH ⁻	0.19 ^c		-330

^a: 3 equiv added; ^b: 1 equiv added; ^c: 2 equiv added; ^d: 20 equiv of acetic acid added

Figure S11. (a) Evolution of the OSWV of **4** (black) (5×10^{-4} M in CH₃CN) [(n-Bu)₄ N]PF₆ scanned at 0.1 V s^{-1} in the presence of 3 equiv of AcO⁻ (red) and in the presence of 3 equiv of AcO⁻ and 1 equiv of Pb²⁺ (green). (b) Evolution of the OSWV of **4** (black) (5×10^{-4} M in CH₃CN) [(n-Bu)₄ N]PF₆] scanned at 0.1 V s^{-1} in the presence of 3 equiv of H₂PO₄⁻ (red) and in the presence of 3 equiv of H₂PO₄⁻ and 1 equiv of Pb²⁺ (green).

Figure S12. (a) Evolution of the OSWV of **7** (black) (5×10^{-4} M in CH₃CN) [(n-Bu)₄ N]PF₆] scanned at 0.1 V s^{-1} in the presence of 3 equiv of AcO⁻ (red) and in the presence of 3 equiv of AcO⁻ and 0.5 equiv of Hg²⁺ (green). (b) Evolution of the OSWV of **7** (black) ($5 \cdot 10^{-4}$ M in CH₃CN) [(n-Bu)₄ N]PF₆] scanned at 0.1 V s^{-1} in the presence of 3 equiv of H₂PO₄⁻ (red) and in the presence of 3 equiv of H₂PO₄⁻ and 0.5 equiv of Hg²⁺ (green).

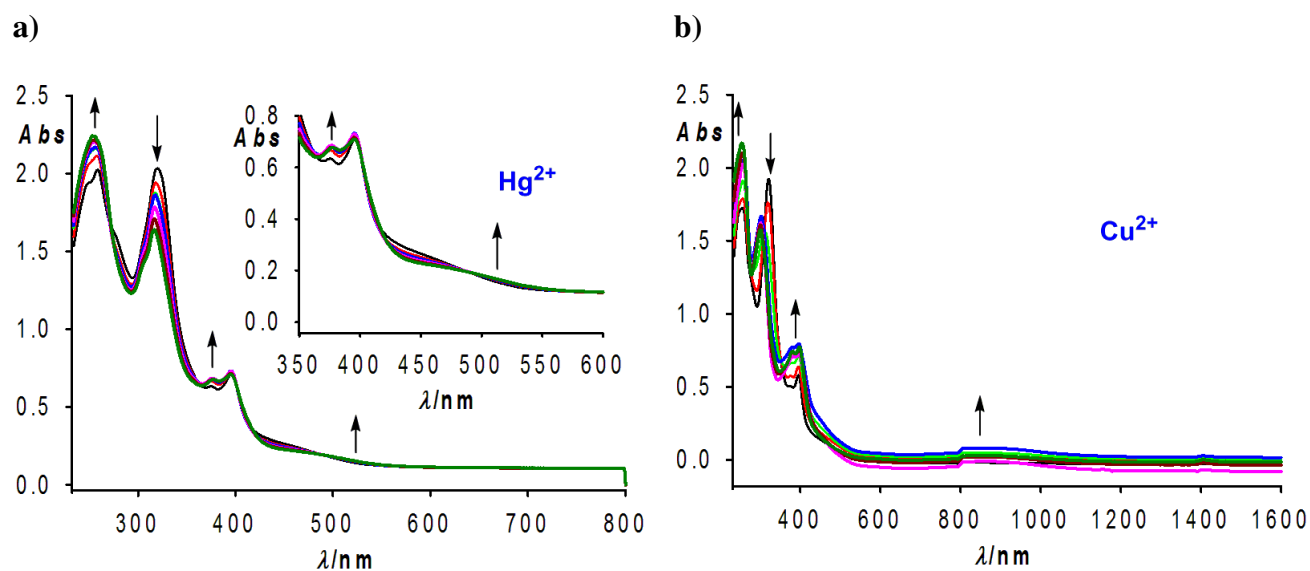

Figure S13. Changes in the absorption spectra of **4** ($c = 5 \cdot 10^{-5}$ M in CH₃CN) upon addition of increasing amounts of (a) Hg(OTf)₂; (b) Cu(OTf)₂, until 1 equiv was added. Arrows indicate absorptions that increase or decrease during the experiment.

Figure S14. Changes in the absorption spectra of **7** ($c = 5 \cdot 10^{-5}$ M in CH_3CN) upon addition of increasing amounts of $\text{Cu}(\text{OTf})_2$, until 2 equiv were added. Arrows indicate absorptions that increase or decrease during the experiment.

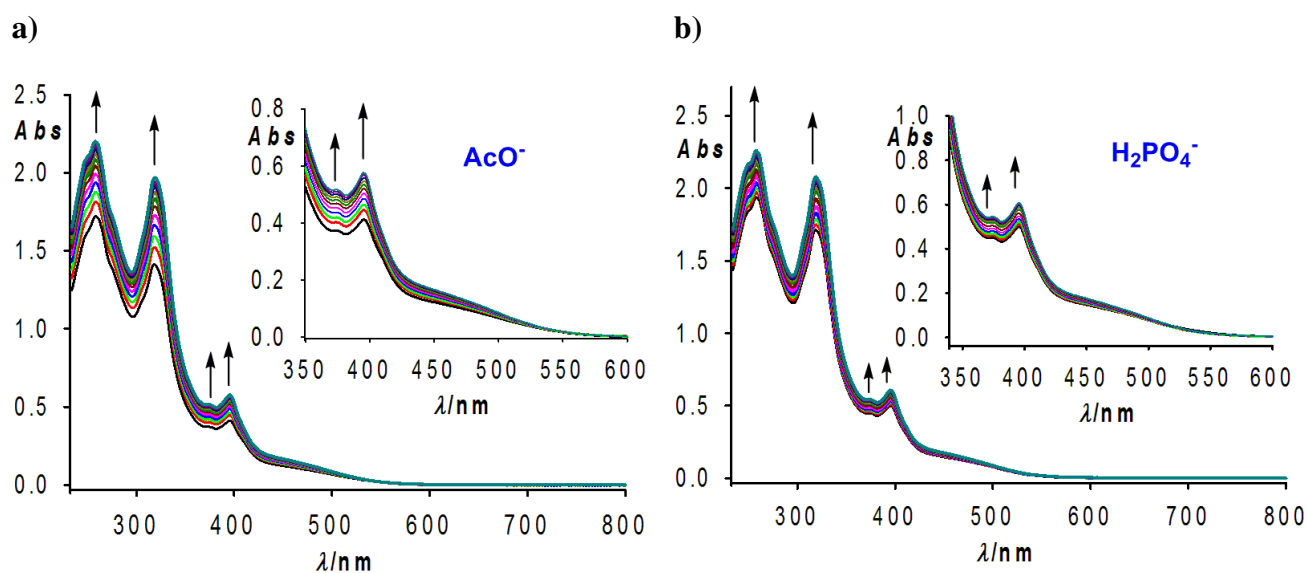

Figure S15. Changes in the absorption spectra of **4** ($c = 5 \cdot 10^{-5}$ M in CH_3CN) upon addition of increasing amounts of: (a) AcO^- until 4 equiv were added, (b) H_2PO_4^- , until 4 equiv were added. Arrows indicate absorptions that increase or decrease during the experiment.

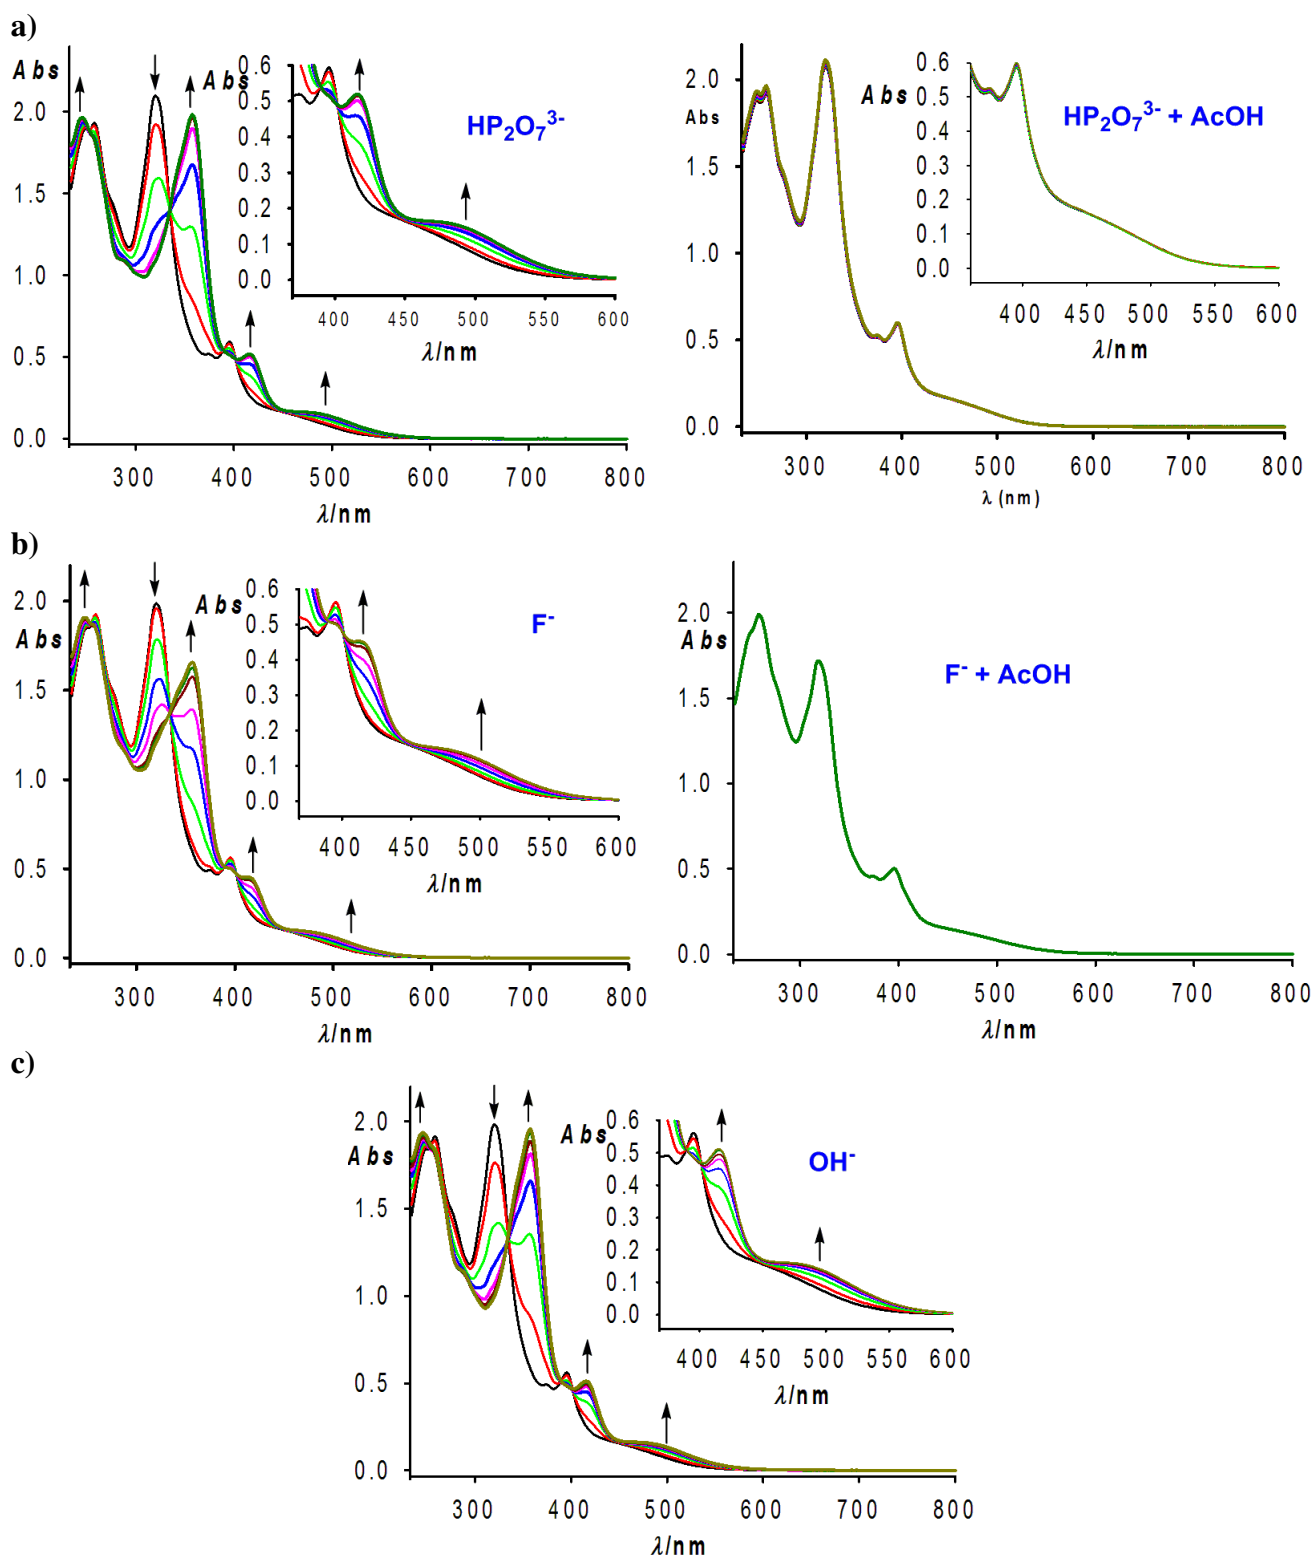

Figure S16. Changes in the absorption spectra of **4** ($c = 5 \times 10^{-5} \text{ M}$ in CH_3CN) upon addition of increasing amounts of (a) $\text{HP}_2\text{O}_7^{3-}$ anion, until 3 equiv (left) and in the present of 20 equiv of acetic acid (right); (b) F^- anion, until 3 equiv (left) and in the present of 20 equiv of acetic acid (right). (c) Changes in the absorption spectra of **4** ($c = 5 \times 10^{-5} \text{ M}$ in CH_3CN) upon addition of increasing amounts of OH^- anion. Arrows indicate absorptions that increase or decrease during the experiment.

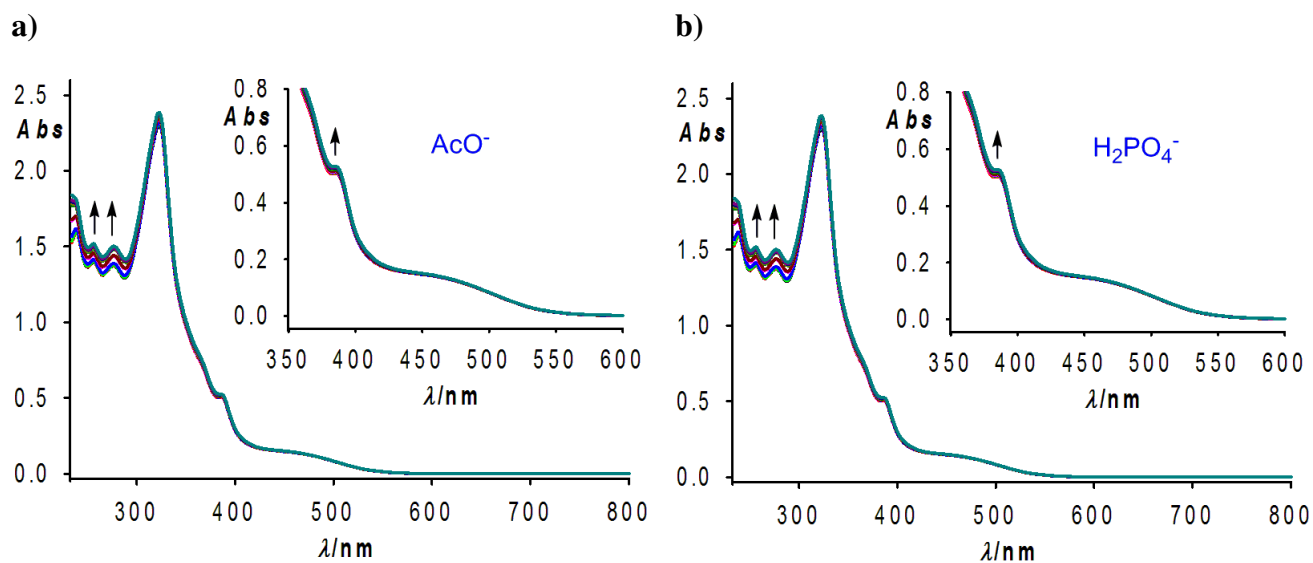

Figure S17. Changes in the absorption spectra of **7** ($c = 5 \cdot 10^{-5}$ M in CH_3CN) upon addition of increasing amounts of (a) AcO^- , until 2 equiv were added; (b) H_2PO_4^- , until 2 equiv were added. Arrows indicate absorptions that increase or decrease during the experiment.

Figure S18. Changes in the absorption spectra of **7** ($c = 5 \times 10^{-5}$ M in CH_3CN) upon addition of increasing amounts of $\text{HP}_2\text{O}_7^{3-}$ anion, until 3 equiv (left) and in the presence of 20 equiv of acetic acid (right). Arrows indicate absorptions that increase or decrease during the experiment.

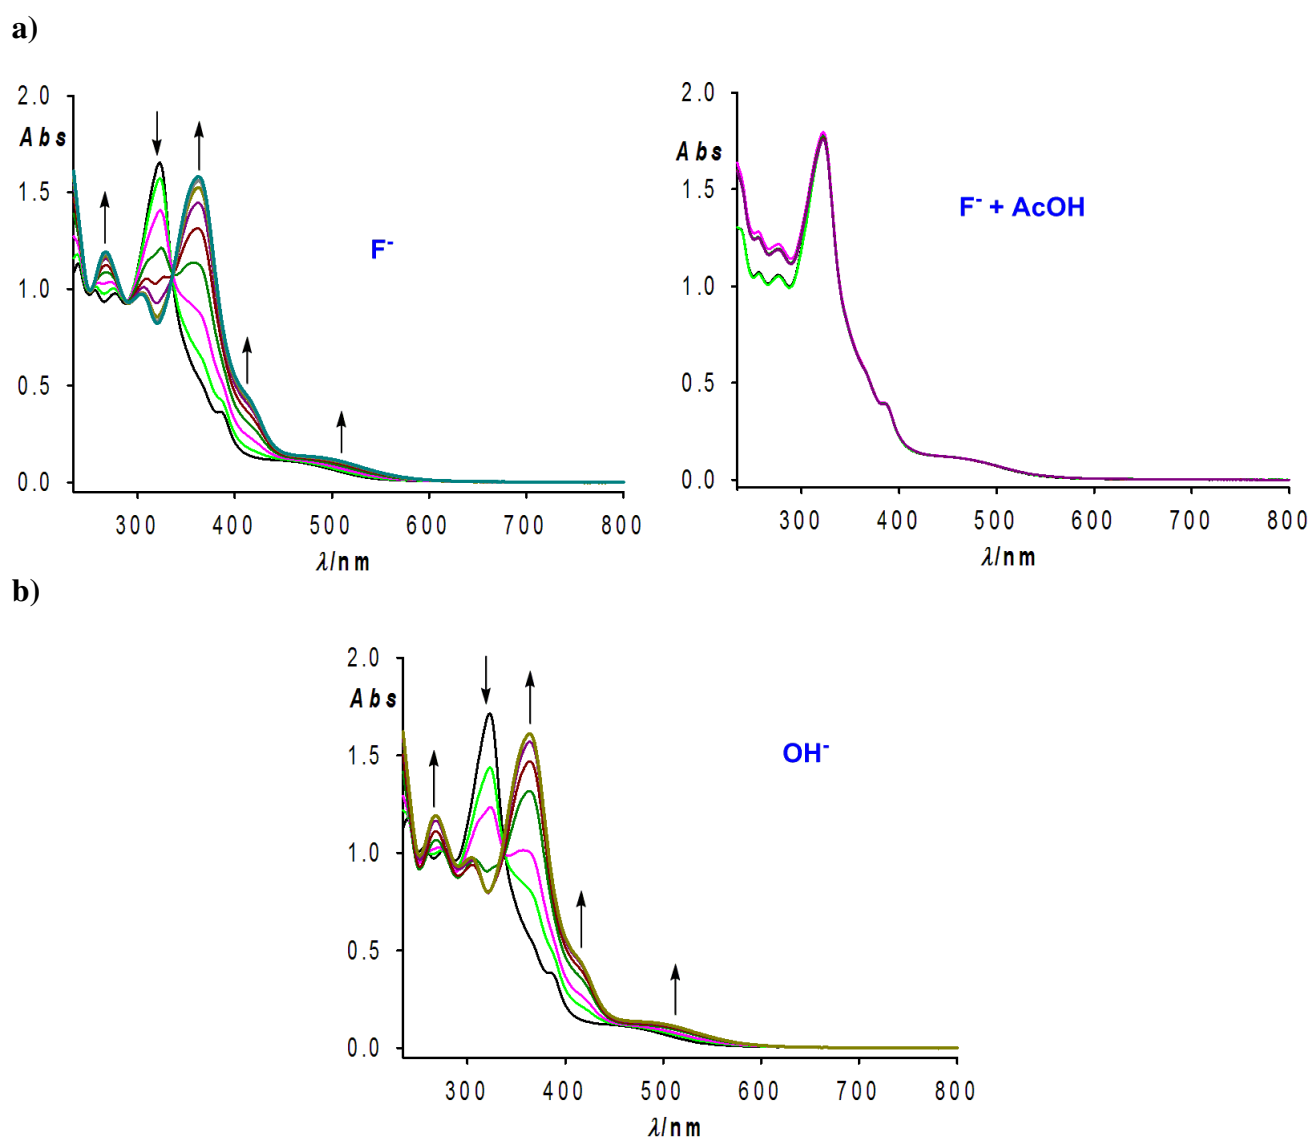

Figure S19. Changes in the absorption spectra of **7** ($c = 5 \times 10^{-5} \text{ M}$ in CH_3CN) upon addition of increasing amounts of (a) F^- anion, until 3 equiv (left) and in the present of 20 equiv of acetic acid (right). (b) Changes in the absorption spectra of **7** ($c = 5 \times 10^{-5} \text{ M}$ in CH_3CN) upon addition of increasing amounts of OH^- anion. Arrows indicate absorptions that increase or decrease during the experiment.

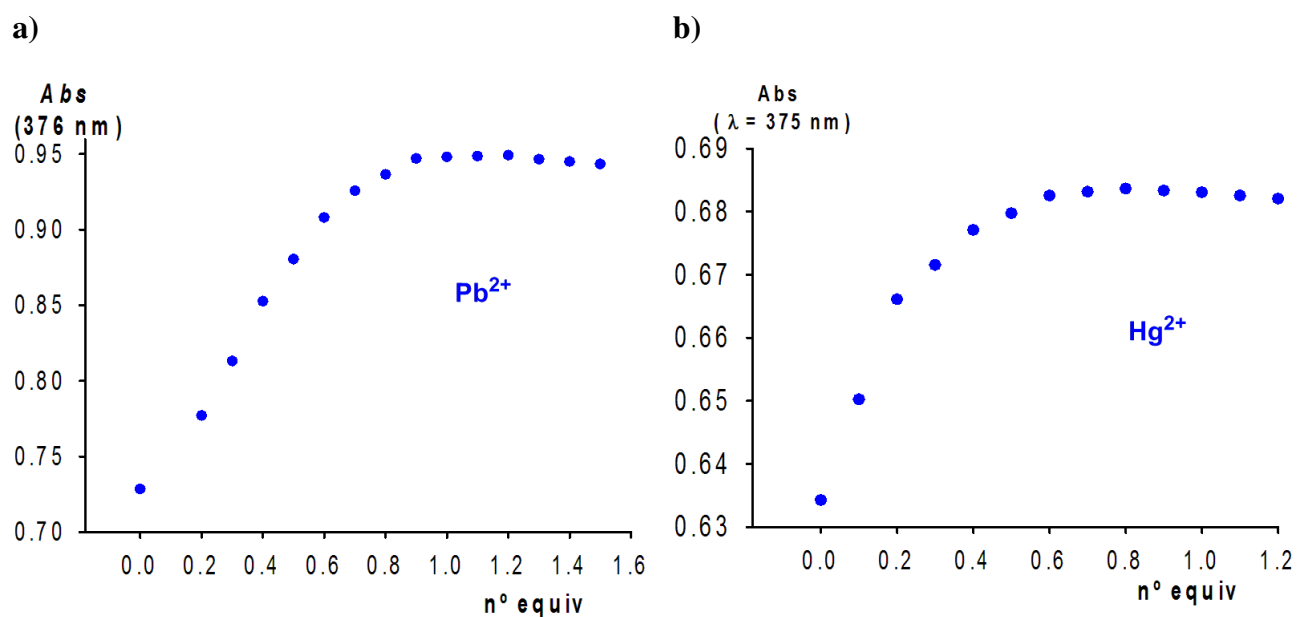

Figure S20. Change of absorbance of **4** ($c = 1 \times 10^{-4} \text{ M}$ in CH_3CN) at $\lambda = 375 \text{ nm}$ upon addition of (a) Pb^{2+} , indicating the formation of a 1:1 complex; and (b) Hg^{2+} , indicating the formation of a 2:1 complex.

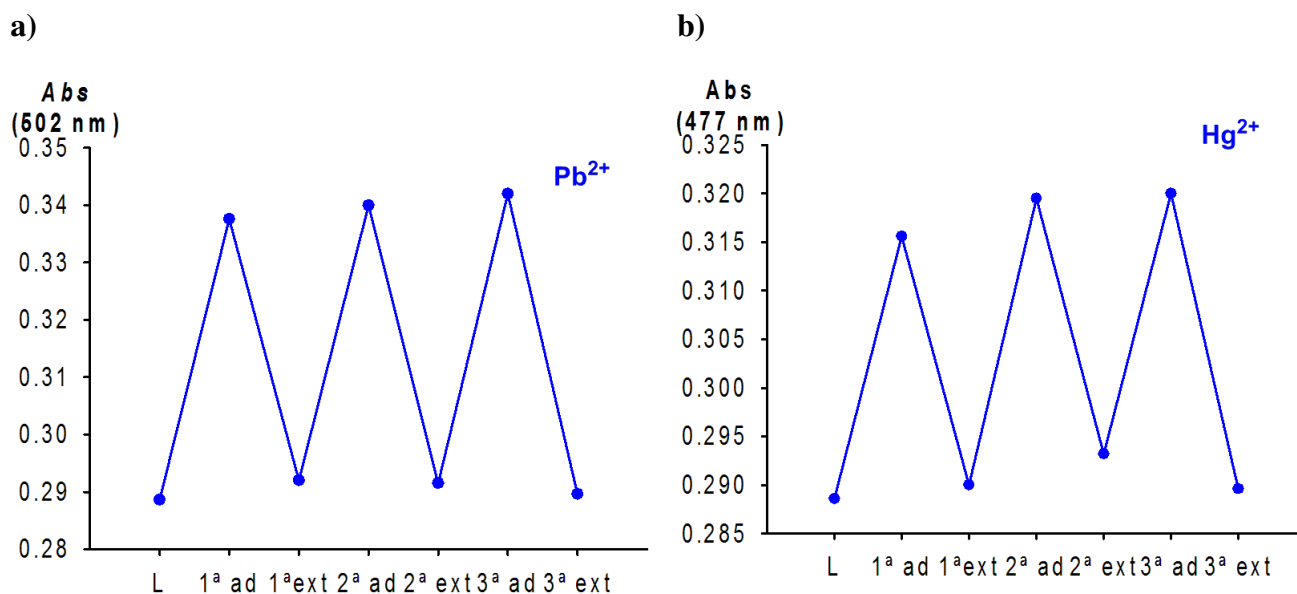

Figure S21. Stepwise complexation/decomplexation (extraction with H_2O) cycles of ligand **4** ($c = 1 \cdot 10^{-4} \text{ M}$ in CH_2Cl_2) in the presence of (a) $\text{Pb}(\text{ClO}_4)_2$ and (b) $\text{Hg}(\text{OTf})_2$; carried out by UV/Vis analysis.

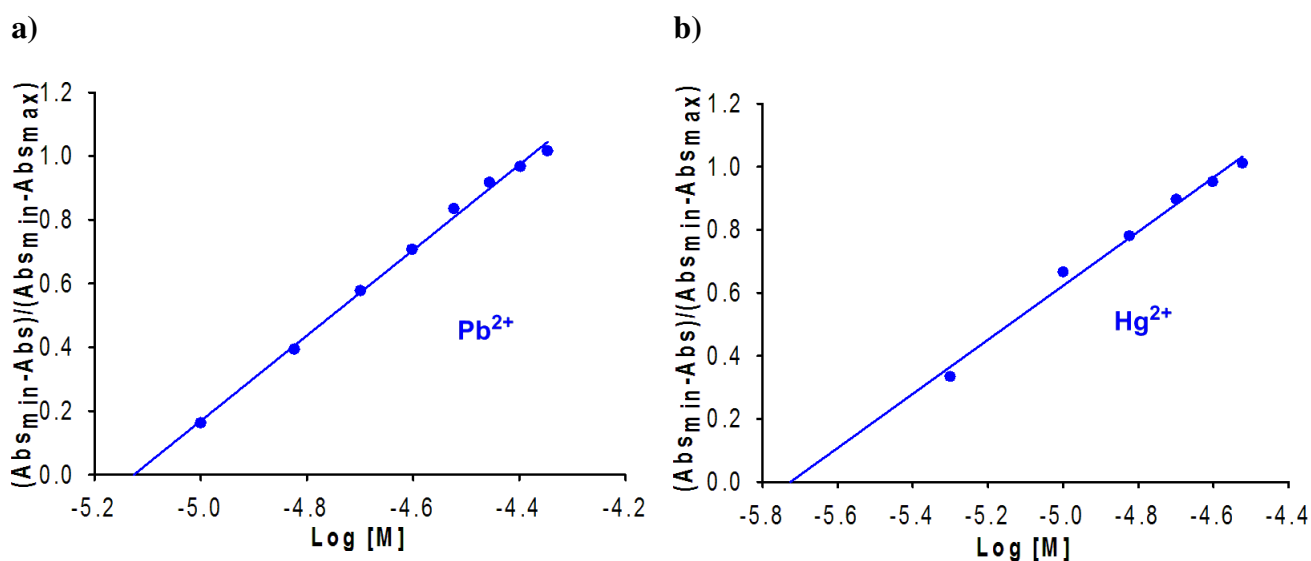

Figure S22. Absorbance of **4** ($c = 5 \times 10^{-5}$ M in CH_3CN) at each concentration of cation added (a) $Pb(ClO_4)_2$; (b) $Hg(OTf)_2$, normalized between the minimum absorbance, found at zero equiv of metal cation; and the maximum absorbance, found at (a) $[Pb^{2+}] = 7.47 \cdot 10^{-6}$ M; (b) $[Hg^{2+}] = 1.22 \cdot 10^{-6}$ M.

Figure S23. Absorbance of **7** ($c = 5 \times 10^{-5}$ M in CH_3CN) at each concentration of cation added $Hg(OTf)_2$, normalized between the minimum absorbance, found at zero equiv of metal cation; and the maximum absorbance, found at $[Hg^{2+}] = 1.55 \cdot 10^{-6}$ M.

Table S2. UV-vis data of receptor **4** and **7** in the presence of anions.

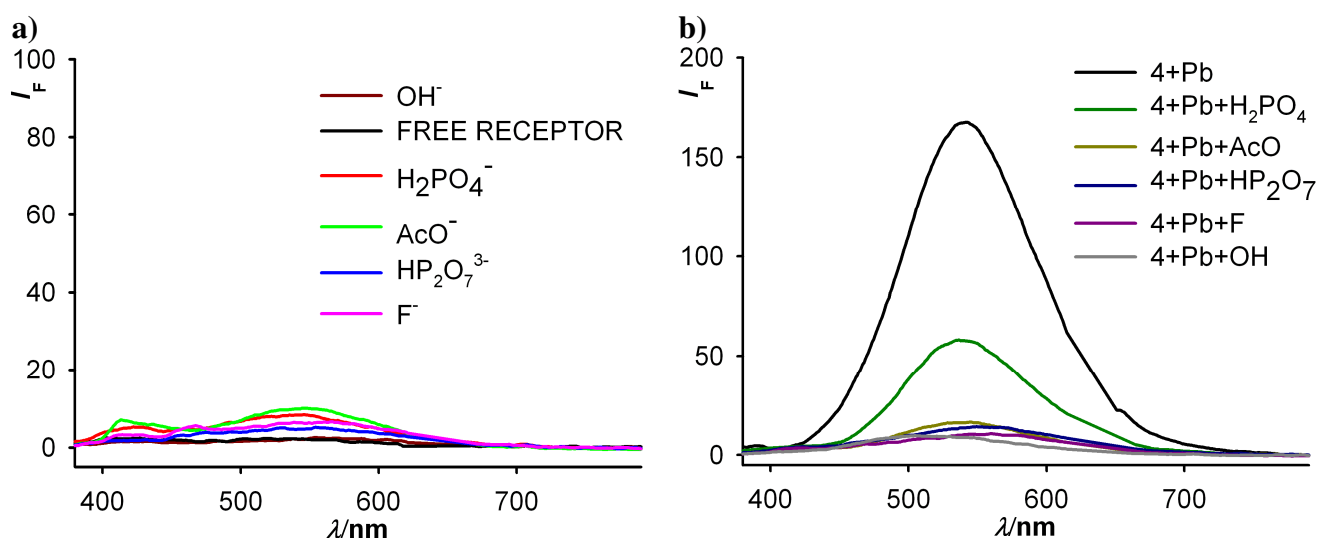

Figure S40. (a) Changes in the fluorescence emission spectrum of **4** ($c=1 \cdot 10^{-5}$ M in CH_3CN) upon addition of 2 equiv of several anions. Emission monitored at $\lambda_{\text{exc}} = 317$ nm. (b) Changes in the fluorescence emission spectrum of $[\mathbf{4} \cdot \text{Pb}^{2+}]$ ($c=1 \cdot 10^{-5}$ M in CH_3CN) upon addition of 2 equiv of several anions. Emission monitored at $\lambda_{\text{exc}} = 317$ nm

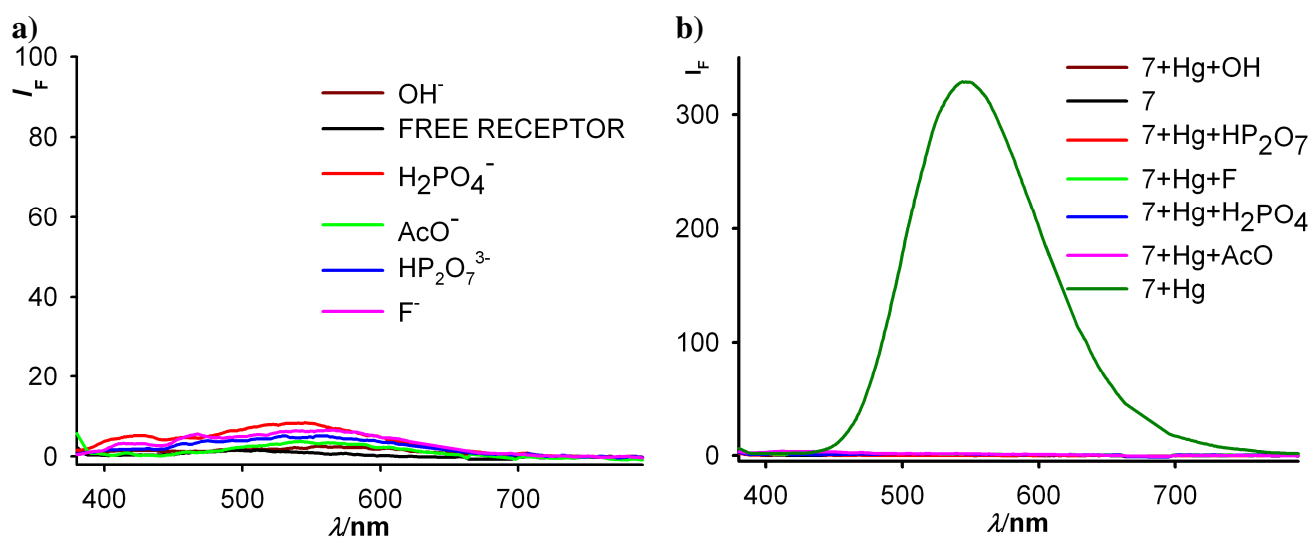

Figure S41. (a) Changes in the fluorescence emission spectrum of **7** ($c=1 \cdot 10^{-5}$ M in CH_3CN) upon addition of 2 equiv of several anions. Emission monitored at $\lambda_{\text{exc}} = 340$ nm. (b) Changes in the fluorescence emission spectrum of $[\mathbf{7} \cdot \text{Hg}^{2+}]$ ($c=1 \cdot 10^{-5}$ M in CH_3CN) upon addition of 2 equiv of several anions. Emission monitored at $\lambda_{\text{exc}} = 340$ nm.

Experimental Section.-

General Comments.- Melting points were determined on a hot-plate melting point apparatus and are uncorrected. ^1H - and ^{13}C -NMR spectra were recorded at 400 and 100 MHz, respectively. Chemical shifts refer to signals of tetramethylsilane in the case of ^1H and ^{13}C spectra. The following abbreviations are used to represent the multiplicity of the signals: s (singlet), bs (broad singlet), d (doublet), dd (double doublets) m (multiplet) st (pseudotriplet), Cq (quaternary carbon atom).

UV-vis spectra were carried out in a UV-vis-NIR spectrophotometer using a dissolution cell of 10 mm path. The samples were solved in CH_3CN ($c = 5 \times 10^{-5} \text{ M}$) and the spectra were recorded with the spectra background corrected before and after of the sequential additions of aliquots of 0.2 equiv of cations/anions in H_2O ($c = 2.5 \times 10^{-2} \text{ M}$).

Fluorescence spectra were carried out in a fluorescence spectrophotometer using a fluorescence cell 10 mm ($c \approx 1 \times 10^{-5} \text{ M}$ in CH_3CN), as it is stated in the corresponding figure captions. Before recording the spectra, the samples were deoxygenated, to remove fluorescence quenching via oxygen, by bubbling nitrogen for at least 10 min. All the spectra were recorded before and after the sequential additions of aliquots of 0.2 equiv of a solution of cations in H_2O ($c = 2.5 \times 10^{-3} \text{ M}$). Quantum yield values were measured with respect to anthracene as standard ($\Phi = 0.27 \pm 0.01$)¹, using the equation $\Phi_x/\Phi_s = (S_x/S_s) [(1-10^{-A_s})/(1-10^{-A_x})]^2 (n_s^2/n_x^2)$ where x and s indicate the unknown and standard solution, respectively, Φ is the quantum yield, S is the area under the emission curve A is the absorbance at the excitation wavelength and n is the index of refraction.

CV and OSWV techniques were performed with a conventional three-electrode configuration consisting of platinum working and auxiliary electrodes and a Ag/AgCl reference electrode. The experiments were carried out with a $\approx 10^{-4} \text{ M}$ solution of sample in CH_3CN containing 0.1 M ($n\text{-C}_4\text{H}_9$)₄PF₆ (TBAPF₆) as supporting electrolyte. All the potential values reported are relative to the decamethylferrocene (DMFc) couple at room temperature. Deoxygenation of the solutions was achieved by bubbling nitrogen for at least 10 min and the working electrode was cleaned after each run. The cyclic voltammograms were recorded with a scan rate increasing from 0.05 to 1.00 Vs^{-1} , while the OSWV were recorded at a scan rate of 100 mVs^{-1} with a pulse height of 10 mV and a step time of 50 ms. Typically, receptor ($1 \times 10^{-4} \text{ M}$) was dissolved in CH_3CN (5 mL) and TBAPF₆ (base electrolyte) (0.190 g) added. The guest under investigation was then added as a $2.5 \times 10^{-2} \text{ M}$ solution in CH_3CN using a microsyringe whilst the cyclic voltammetric properties of the solution were monitored. DMFc was used as an external reference both for potential calibration and for reversibility criteria.
