## (A) General Methods

The reagents (chemicals) were purchased from commercial sources, and used without further purification. Analytical thin layer chromatography (TLC) was HSGF 254 (0.15-0.2 mm thickness). All products were characterized by their NMR and MS spectra. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded in deuterochloroform $\left(\mathrm{CDCl}_{3}\right)$ on a 300 MHz instrument. Chemical shifts were reported in parts per million (ppm, $\delta$ ) downfield from tetramethylsilane. Proton coupling patterns are described as singlet (s), doublet (d), triplet (t), quartet (q), multiplet (m), and broad (br). Low- and high-resolution mass spectra (LRMS and HRMS) were measured on spectrometer. Optical rotations were reported as follows: $[\alpha]_{\mathrm{D}}^{22}$ (c: $\mathrm{g} / 100 \mathrm{~mL}$, in solvent).

## (B) General Procedure for the Asymmetric Alkylation Reactions

## General Procedure for the Synthesis of (S,2S)-3a:

The $\mathrm{Ni}(\mathrm{II})$ complex of glycine $(\mathrm{S}) \mathbf{- 1 a}(200 \mathrm{mg}, 0.40 \mathrm{mmol})$ was dissolved in DMF (2 $\mathrm{mL})$. The sodium hydroxide ( $19.2 \mathrm{mg}, 0.48 \mathrm{mmol}$ ) was added at ambient conditions. Then the 1,1,1-trifluoro-4-iodobutane $2 \mathbf{2 a}(104 \mathrm{mg}, 0.44 \mathrm{mmol})$ was added and the reaction mixture was stirred for 0.5 h . The reaction was quenched by pouring the crude reaction mixture over 30 mL aq. sat. $\mathrm{NH}_{4} \mathrm{Cl}$. The suspension was extracted with ethyl acetate (3 times). The combined organic layers were dried with $\mathrm{MgSO}_{4}$, concentrated, and purified by column chromatography on silica gel (petroleum ether/ ethyl acetate $=1 / 1)$ to give $(S, 2 S)$-3a as a red solid.

Procedure for the Synthesis of (S,2S)-3d: The Ni(II) complex of alanine (S)-1b (200 $\mathrm{mg}, 0.39 \mathrm{mmol}$ ) was dissolved in DMF ( 2 mL ). The sodium hydroxide ( $131 \mathrm{mg}, 1.17$ mmol) was added at ambient conditions. Then the 1,1,1-trifluoro-4-iodobutane 2a $(232 \mathrm{mg}, 0.98 \mathrm{mmol})$ was added and the reaction mixture was stirred for 1 h . The reaction was quenched by pouring the crude reaction mixture over 30 mL aq. sat. $\mathrm{NH}_{4} \mathrm{Cl}$. The suspension was extracted with ethyl acetate (3 times). The combined organic layers were dried with $\mathrm{MgSO}_{4}$, concentrated, and purified by column chromatography on silica gel (petroleum ether/ ethyl acetate $=1 / 1$ ) to give $(S, 2 S)$ - $\mathbf{3 d}$ as a red solid. HPLC (Chiralpak IA, $i$-propanol $/ n$-hexane $=40 / 60$, flow rate 1.0 $\mathrm{mL} / \mathrm{min}, \lambda=254 \mathrm{~nm}), \mathrm{t}_{\text {minor }}=6.0 \mathrm{~min}, \mathrm{t}_{\text {major }}=9.2 \mathrm{~min}, \mathrm{de}=99 \%$.

Procedure for the Synthesis of (S)-4a: The crystallized complex (S,2S)-3a (1 g, 1.65 mmol ) was decomposed by refluxing a suspension in a mixture of aqueous 6 N HCl $(1 \mathrm{~mL})$ and $\mathrm{MeOH}(15 \mathrm{~mL})$ for 30 min , until the red color of the solution disappeared, as described previously. The reaction was cooled to room temperature and then evaporated to dryness. Water ( 20 mL ) was added to the residue to form a clear solution, and this solution was then separated by column chromatography on $\mathrm{C}_{18}$-reversed phase (230-400 mesh) silica gel. Pure water as an eluent was employed to remove the green $\mathrm{NiCl}_{2}$ and excess HCl ; water was then used to obtain optically pure product $(S)-4 \mathbf{a}(293 \mathrm{mg}, 96 \%):[\alpha]_{\mathrm{D}}{ }^{24}=+7.9(c=0.38 \mathrm{~g} / 100 \mathrm{~mL}, 6 \mathrm{NHCl})$. The ligand BPB that decomposed from $(S, 2 S)$-3a was recovered by MeOH eluent ( 608 mg , $96 \%$ ), and the column chromatography was washed with 100 mL of MeOH for further use.

## Procedure for the synthesis of $(\mathbf{S})-\mathbf{1}^{\mathbf{1}}$.

(S)-BPB ( $1 \mathrm{~g}, 2.60 \mathrm{mmol})$, Gly $(976 \mathrm{mg}, 13.0 \mathrm{mmol}), \mathrm{Ni}\left(\mathrm{NO}_{3}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}(1.52 \mathrm{~g}, 5.21$ $\mathrm{mmol}), \mathrm{MeOH}(50 \mathrm{~mL})$ was added as solvent. And $\mathrm{NaH}(55-65 \%$ in oil, $1.04 \mathrm{~g}, 26$ mmol ), $\mathrm{KOH}(437 \mathrm{mg}, 7.81 \mathrm{mmol})$ were added successively. The resulting mixture was refluxed for 2 h and then the reaction was terminated and cooled. The solution was neutralized with acetic acid. After 12 h the separated crystalline solid was filtered and washed with 100 mL of ethanol, followed by stirring in methane/water (v/v ) 1:2, 200 mL ), then filtered to form a red crystal ( 1.27 g , yield $98 \%$ ). The complex was
sufficiently pure for further use without additional purification.

## (C) Analytical Characterization Data of Asymmetric Alkylation

## Products

## Ni(II)-(S)-BPB/(S)-2-Amino-6,6,6-Trifluorohexanoic Acid Schiff Base Complex

Analytical high performance liquid chromatography was carried out using the Dionex

ASI-100 automated sampler, using the Chiralpak IA column. The loading loop was 5 $\mu \mathrm{L}$. The eluting employed was an isocratic mixture of $n$-hexane and $i$-propanol (60:40 respectively) at a flow of $1 \mathrm{~mL} / \mathrm{min}$ unless stated. Retention times are reported in minutes. The enantiomeric excess was calculated from the integration of the absorption peaks at 254 nm .
