## Preparation of alkynes and alkynes

Commercially unavailable allylsilanes were easily furnished by reacting allylmagnesium chloride with the corresponding chlorosilane. ${ }^{1}$ The propargylsilane was received out of lithiation of 2-heptyne and quenching with the accordant chlorosilane. ${ }^{2}$ A copper-mediated allylation of methyl propiolate with allylbromide gave the eneyneoate in one step ${ }^{3}$ while the alkynylphenone was produced in an alkylation-oxidation sequence commencing with benzaldehyde. ${ }^{4}$

## General procedure A for the cobalt-catalyzed Alder-ene reaction with electron-rich alkynes

Anhydrous zinc iodide ( $20 \mathrm{~mol} \%$ ), zinc dust ( $20 \mathrm{~mol} \%$ ) and $\mathrm{CoBr}_{2}$ (dppp) ( $10 \mathrm{~mol} \%$ ) were suspended in 1.0 mL dichloromethane under argon atmosphere. Then the terminal alkene ( 1.0 eq.) and the alkyne ( 1.5 eq.) were added and the mixture was stirred at room temperature for 16 h or until complete conversion of the starting materials was monitored by GC. The reaction mixture was filtered over a short pad of silica gel and the solvent was removed under vacuum. The residue was then purified by flash column chromatography or bulb-to-bulb-distillation.

## General procedure B for the cobalt-catalyzed Alder-ene reaction with electron-poor alkynes

Anhydrous zinc iodide ( $40 \mathrm{~mol} \%$ ), zinc dust ( $40 \mathrm{~mol} \%$ ) and $\mathrm{CoBr}_{2}$ (dppe) ( $20 \mathrm{~mol} \%$ ) were suspended in 1.0 mL dichloromethane under argon atmosphere. Then the terminal alkene ( 1.0 eq.) was added. The alkyne ( 3.0 eq.) was added to the reaction mixture over 7 h in seven portions. Then the mixture was stirred at room temperature for another 9 h or until complete conversion of the starting materials was monitored by GC. The reaction mixture was filtered over a short pad of silica gel and the solvent was removed under vacuum. The residue was then purified by flash column chromatography or bulb-to-bulb-distillation.
