## General Experimental Details

Unless otherwise specified, all reactions were carried out under an inert $\mathrm{N}_{2}$ atmosphere in oven-dried glassware. Flash column chromatography was performed using the analytical grade solvents indicated and Merck silica gel ( $40-63 \mu \mathrm{~m}, 60 \AA$ ) as the stationary phase. Reactions and chromatography fractions were monitored with Merck silica gel $60 \mathrm{~F}_{254}$ glass plates and visualized using a 254 nm UV lamp and/or by treatment with a suitable dip followed by heating: potassium permanganate and ceric ammonium molybdate. Tetrahydrofurane (THF), and diethyl ether $\left(\mathrm{Et}_{2} \mathrm{O}\right)$ were distilled from sodium benzophenone ketyl. Diiosopropylamine was distilled from and stored over $\mathrm{CaH}_{2}$. $n$-Butyllithium ( $n$ - BuLi ) was titrated with diphenylacetic acid prior to use. All other solvents, as well as starting materials and reagents were used without further purification from commercial sources.

Unless otherwise specified, proton $\left({ }^{1} \mathrm{H}\right)$ and carbon $\left({ }^{13} \mathrm{C}\right)$ spectra were recorded at $18{ }^{\circ} \mathrm{C}$ in base filtered $\mathrm{CDCl}_{3}$ on Varian Mercury spectrometers operating at $300 \mathrm{~Hz}, 400 \mathrm{MHz}$ and 600 MHz for proton nuclei $(75 \mathrm{MHz}, 100 \mathrm{MHz}$ and

150 MHz for carbon nuclei). For ${ }^{1} \mathrm{H}$ NMR spectra signals arising from residual protio-forms of the solvent were used as the internal standards. ${ }^{1} \mathrm{H}$ NMR data are recorded as follows: chemicals shift ( $\delta$ ) [multiplicity, coupling constant(s) $J(\mathrm{~Hz})$, relative integral] where multiplicity is defiened as: $s=$ singlet; $d=$ doublet; $t=t r i p l e t ;$ $\mathrm{q}=\mathrm{quartet} ; \mathrm{m}=$ multiplet $\mathrm{br}=$ broad or combinations of the above. The residual $\mathrm{CHCl}_{3}$ peak ( $\delta 7.26$ ) was used as reference for ${ }^{1} \mathrm{H}$ NMR spectra. The central peak ( $\delta 77.16$ ) of the $\mathrm{CDCl}_{3}$ 'triplet' was used as reference for proton-decoupled ${ }^{13} \mathrm{C}$ NMR spectra.

Low- and high-resolution electrospray (ESI) mass spectra were obtained on a Varian MAT 711 MS instrument operating in either positive or negative ionization modes. Fast atom bombardment (FAB) mass spectra were measured on a VG ProSpec Mass Spectrometer.

Melting points were measured on a Büchi melting point B-540 system and are uncorrected.

X-ray analysis measurements of 7 were made on a Bruker APEX ${ }^{1}$ CCD area detector with graphite monochromated Mo- $\mathrm{K}_{\alpha}$ radiation $(\lambda=0.71069 \AA)$. The data collections for $\mathbf{1 4}$ and $\mathbf{1 7}$ were performed on an Oxford Diffraction Xcalibur diffractometer at 173 K using graphite monochromated $\mathrm{Mo}-\mathrm{K}_{\alpha}$-radiation $(\lambda=0.71073 \AA)$.

## Experimental Procedures

## Aldehydes 4

Ozone was bubbled into a mixture of $3(26.5 \mathrm{~g}, 118 \mathrm{mmol}), \mathrm{NaHCO}_{3}(0.33 \mathrm{~g}$, $4 \mathrm{mmol}), \mathrm{CH}_{2} \mathrm{Cl}_{2}(200 \mathrm{~mL})$ and $\mathrm{MeOH}(200 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ until a blue color developed. Excess ozone was then removed by bubbling $\mathrm{N}_{2}$ through the mixture. $\mathrm{Me}_{2} \mathrm{~S}(14.5 \mathrm{~mL}, 12.2 \mathrm{~g}, 197 \mathrm{mmol})$ was added and the mixture was left to stir overnight at rt The mixture was then concentrated in vacuo and purified by flash
column chromatography (hexanes/EtOAc $=2 / 1)$ to give $25.3 \mathrm{~g}(112 \mathrm{mmol}, 94 \%)$ of $\mathbf{4}$ as a colorless oil.

TLC: $\quad R_{\mathrm{f}}=0.22($ hexanes $/ \mathrm{EtOAc}=2 / 1)\left[\mathrm{KMnO}_{4}\right]$

## $t$-Butyldimethylsilyloxybicyclo[2.2.2]octanone 6

6

A mixture of $4(6.27 \mathrm{~g}, 27.7 \mathrm{mmol}), 2 \mathrm{~N} \mathrm{HCl}$ aq ( $5.54 \mathrm{~mL}, 11.1 \mathrm{mmol})$, and acetone $(105 \mathrm{~mL})$ was heated at reflux for 10 min . After cooling, $\mathrm{NaHCO}_{3}(0.931 \mathrm{~g}$, $11.1 \mathrm{mmol})$ and water $(2.5 \mathrm{~mL})$ were added and the mixture was concentrated in vacuo. The residue was extracted with ethyl ether $(3 \times 40 \mathrm{~mL})$, washed with saturated $\mathrm{NaHCO}_{3}$ aq $(10 \mathrm{~mL})$ and brine $(20 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, filtered, and concentrated in vacuo to give a mixture of diastereomers $\mathbf{5}$ and $\mathbf{5 a}(3.54 \mathrm{~g}, 15.6 \mathrm{mmol}, 56 \%)$, which was carried on without further purification.

A solution of the hydroxybicyclo[2.2.2]octanones $\mathbf{5}$ and $\mathbf{5 a}$ obtained above ( 3.76 g 16.6 mmol ), $t$-butyldimethylsilyl chloride ( $3.0 \mathrm{~g}, 19.9 \mathrm{mmol}$ ) and imidazole ( 1.70 g , $24.9 \mathrm{mmol})$ in DMF ( 20 mL ) was stirred overnight at rt The mixture was poured into water $(200 \mathrm{~mL})$ and extracted with ethyl ether $(3 \times 100 \mathrm{~mL})$. The organic phase was washed with $2 \mathrm{~N} \mathrm{HCl} \mathrm{aq} \mathrm{( } 100 \mathrm{~mL}$ ), water $(3 \times 80 \mathrm{~mL})$, and brine $(100 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, filtered, and concentrated in vacuo. The residue was purified by flash column chromatography (hexanes/EtOAc $=19 / 1$ ) to give $3.65 \mathrm{~g} 6(10.7 \mathrm{mmol}, 65 \%)$ as well as $0.50 \mathrm{~g} \mathbf{6 a}(1.46 \mathrm{mmol}, 9 \%)$, both as colorless oils. $0.46 \mathrm{~g}(2.05 \mathrm{mmol}, 12 \%)$ of the starting materials 5 and 5a could be reisolated.

## Diol 8

A LDA solution was prepared by dissolving diisopropylamine $(1.35 \mathrm{~mL}, 0.97 \mathrm{~g}$, $9.59 \mathrm{mmol})$ in THF $(4 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ and adding a 2.39 m solution of $n$-butyllithium in hexanes ( $3.65 \mathrm{~mL}, 8.71 \mathrm{mmol}$ ) dropwise. After stirring at $-78^{\circ} \mathrm{C}$ for 30 min the reaction mixture was warmed to $0^{\circ} \mathrm{C}$ for 10 min and cooled to $-78^{\circ} \mathrm{C}$ again. To a solution of $7(400 \mathrm{mg}, 1.24 \mathrm{mmol})$ in THF $(40 \mathrm{~mL})$ was added gradually the prepared LDA solution at $-78{ }^{\circ} \mathrm{C}$. After addition was completed, stirring was continued for 30 min and the temperature was then raised to $-40^{\circ} \mathrm{C}$ for 30 min . A stream of formaldehyde gas, generated by thermolysis $\left(160^{\circ} \mathrm{C}\right)$ of paraformaldehyde was introduced through a cannula in a stream of $\mathrm{N}_{2}$ for 10 min . The reaction mixture was quenched by addition of saturated $\mathrm{NH}_{4} \mathrm{Cl}$ aq ( 4 mL ) and extracted with EtOAc $(3 \times 20 \mathrm{~mL})$. The combined organic phases were filtered through celite and washed with EtOAc. After removing the solvent in vacuo, the residue was purified by flash column chromatography (hexanes/EtOAc $=5 / 1 \rightarrow 1 / 1)$ to give $232 \mathrm{mg} 8(0.61 \mathrm{mmol}$, 49\%) as a white, crystalline solid.
