## Scheme S1

Figure S1 UV/Vis absorbance changes of compound $\mathbf{9 f}(25 \mu \mathrm{M})$ and MBTH (50 $\mu \mathrm{M}$ ) with varied concentration of tyrosinase ( $0 \mathrm{U}, 0.2 \mathrm{U}, 0.4 \mathrm{U}, 0.6 \mathrm{U}, 0.8$ $\mathrm{U}, 1.0 \mathrm{U} / \mathrm{mL}$ ) over an incubation time of 1 h in phosphate buffer $(20 \mathrm{mM}$, pH 6.4). Arrows indicate trends in absorbance with the addition of tyrosinase.

Figure S2 (A) Emission spectra of BODIPY-modified catechol (13) $(1 \mu \mathrm{M})$ over an incubation time of 1 h with varied concentrations of tyrosinase (from bottom to top): 0 (control), $0.05,0.08,0.12,0.2,1,10,20$ and $40 \mathrm{U} / \mathrm{mL}$. (B) Changes in the emission intensity of BODIPY-modified catechol (13) $(1 \mu \mathrm{~m})$ upon addition of tyrosinase $(40 \mathrm{U} / \mathrm{ml})$ at a fixed time interval of 2 min over a period of 50 min . The measurements were performed in
phosphate buffer solution ( $20 \mathrm{mM}, \mathrm{pH} 6.4$ ) with $\lambda_{\mathrm{ex}}=480 \mathrm{~nm}$.

Figure S3 Changes in the emission intensity of BODIPY-modified catechol (13) $(1 \mu \mathrm{M})$ and tyrosinase ( $40 \mathrm{U} / \mathrm{mL}$ ) upon addition of varied weight of genomic DNA extraction from B16F1 cells. (from top to bottom): 0 (control), $0.5,1,2,10,20 \mu \mathrm{~g}$.

Genomic DNA extraction from B16F1 cells. The cell lines were grown in1640 culture media with $10 \%$ fetal bovin serum. Cells were collected and washed with PBS twice. Then they were lysed in TES buffer ( 10 mM Tris pH 8.0, 100 mM EDTA, $0.5 \%$ SDS) and incubated at $55^{\circ} \mathrm{C}$ overnight with the addition of protease $\mathrm{K}(100 \mu \mathrm{~g} / \mathrm{mL})$ and RNAse ( $20 \mu \mathrm{~g} / \mathrm{mL}$ ). Digested lysates were extracted twice with phenol/ chloroform/isoamyl alcohol (25:24:1) centrifuged at $10000 \times \mathrm{g}$ for 15 min and the organic layer was removed. Then the resulting aqueous layer was incubated with 0.1 volume sodium acetate and 0.8 volume of ice ethanol at $-20^{\circ} \mathrm{C}$ overnight. DNA was precipitated after centrifugation at $12000 \times \mathrm{g}$ for 15 min and was left to air dry. Then it was resuspended in TE buffer ( 10 mM Tris $\mathrm{pH} 7.2,2 \mathrm{mM}$ EDTA pH 8.0).

Figure S4 Changes in the emission intensity of BODIPY-modified catechol (13) (1 $\mu \mathrm{M})$ and tyrosinase ( $40 \mathrm{U} / \mathrm{mL}$ ) upon addition of varied concentrations of reduced glutathione (from bottom to top): 0 (control), $0.1,0.5,1,2,5,10$ $\mu \mathrm{M}$.

Figure S5 Alkaline comet assay for Hela cells (A) and CHO (B) cells treated with compound 9f. Cells were incubated with increasing concentrations of compound $9 f(0,5,10,20$ and $40 \mu \mathrm{M})$ for 48 h . The DNA was stained with propidium iodide (PI).
(A) Hela cell line

(B) CHO cell line

Figure S6 $\gamma$-H2AX immunofluorescence in CHO and Hela cells after incubation with treatment of $20 \mu \mathrm{M}$ compound 9 f for 48 h .

Figure S7 Microphotographs of three different cells after treatment with the compound $\mathbf{9 f}(5 \mu \mathrm{M})$. All the cells were incubated for 48 h with the compound $\mathbf{9 f}$, and stained with $5 \mu \mathrm{~g} / \mathrm{L}$ Hoechst- 33258 .

## Procedures of Synthesis

8-[benzeneboromic acid]-1, 3, 5, 7-tetramethyl-4, 4-difluoro-4-bora-3a, 4a-diaza-s-indacene (10) ${ }^{1}$ TFA (8 drops) was added dropwise to a stirred solution of 2, 4-dimethyl-1H-pyrrole ( $633 \mathrm{mg}, 7 \mathrm{mmol}$ ) and 4-Formylbenzeneboromic acid ( $500 \mathrm{mg}, 3.33 \mathrm{mmol}$ ) in dry THF ( 30 mL ). The reaction was stirred at room temperature until TLC showed complete consumption of the aldehyde. DDQ ( 756 mg , 3.33 mmol ) was added in a single portion, and the reaction was stirred at room temperature overnight. N , N -Diisopropylethylamine ( $4 \mathrm{~mL}, 23 \mathrm{mmol}$ ) and $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ ( $6 \mathrm{~mL}, 47 \mathrm{mmol}$ ) were added, and the reaction was stirred at room temperature for 6 h . The reaction mixture was washed with water $(3 \times 100 \mathrm{~mL})$ and brine $(3 \times 100 \mathrm{~mL})$. The separated organic fractions were dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and the solids were removed by gravity filtration. The crude product was preadsorbed onto 5 mL of silica and dried under vacuum filtered. Flash chromatography (1:3 hexanes/EtOAc) provided $\mathbf{1 0}$ as a bright orange powder ( $250 \mathrm{mg}, 20 \%$ ) after solvent removal.

4-bromo-3, 4-Bis(benzyloxy) phenyl (11) ${ }^{2}$ Benzyl bromide ( $720 \mu \mathrm{~L}, 6 \mathrm{mmol}$ ) and $\mathrm{K}_{2} \mathrm{CO}_{3}(560 \mathrm{mg}, 4 \mathrm{mmol})$ and were added to the solution of 4-Bromocatechol ( 500 $\mathrm{mg}, 2.67 \mathrm{mmol}$ ) in acetone ( 30 mL ). And the mixture was refluxed overnight. The reaction mixture was filtered, and the reaction solvent removed to yield the crude product. And then purified on a silica gel using petroleum ether /EtOAc (1:10) as eluant afford a white solid ( $880 \mathrm{mg}, 90 \%$ ).

8-[3, 4-Bis(benzyloxy)biphenyl]-1, 3, 5, 7-tetramethyl-4, 4-difluoro-4-bora-3a, 4a-diaza-s-indacene (12) ${ }^{2}$ The compounds $\mathbf{1 0}$ ( $100 \mathrm{mg}, 0.27 \mathrm{mmol}$ ) and $\mathbf{1 1}$ ( 110 mg , $0.3 \mathrm{mmol})$ were dissolved in dry THF $(10 \mathrm{~mL})$, and the resulting solution was purged with nitrogen for 1 h . To this solution was added a nitrogen-purged aqueous solution of $2 \mathrm{M} \mathrm{Na}_{2} \mathrm{CO}_{3}(2 \mathrm{~mL}, 4 \mathrm{mmol})$, followed by $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(10 \mathrm{mg}, 3 \mathrm{~mol} \%)$. The reaction mixture was refluxed overnight. The THF was removed under reduced pressure and the residue was taken up into DCM ( 100 mL ), which was washed with brine $(2 \times 50 \mathrm{~mL})$, separated and dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration, the solvent was removed under reduced pressure, to yield a dark red residue. The residue was chromatographed on silica gel with a solvent gradient (first petroleum ether/ EtOAc (100:1), then petroleum ether/ EtOAc (10:1)) to afford an orange solid (145 mg, $90 \%$ yield).

8-[3,4-Dihydroxybiphenyl]-1,3,5,7-tetramethyl-4,4-difluoro-4-bora-3a,4a-diaza-s-indacene (13). ${ }^{3}$ The compounds $12(10 \mathrm{mg}, 0.016 \mathrm{mmol})$ in 20 mL THF was mixed with $10 \% \mathrm{Pd}(\mathrm{OH})_{2}(1 \mathrm{mg})$ and stirred overnight under hydrogen from a balloon. The suspension was filtered and the solvent was removed under reduced pressure, to yield a dark red residue. The residue was chromatographed on silica gel with a solvent gradient (first $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, then $\mathrm{CH}_{3} \mathrm{OH}$ ) to afford an orange solid ( $5 \mathrm{mg}, 72 \%$ yield).
