| pyridine | Ar | 2 | 66 | 3 | $1.9 \pm 0.1$ | $2.0 \pm 0.1$ |
|  | Xe | 1.2 |  |  | $2.1 \pm 0.1$ | $2.3 \pm 0.1$ |
|  |  |  |  |  | $2.0 \pm 0.2$ | $2.1 \pm 0.2$ |
| imidazole | Ar | 2 | 60 | 3 | $1.9 \pm 0.1$ | $2.4 \pm 0.1$ |
|  | Xe | 1.2 |  |  | $2.1 \pm 0.1$ | $2.5 \pm 0.1$ |
|  |  |  |  |  | $2.0 \pm 0.2$ | $2.4 \pm 0.2$ |
| TMEDA | Ar | 2 | 105 | 6 | $1.7 \pm 0.1$ | $(2.1 \pm 0.1)^{\mathrm{f}}$ |
|  | Xe | 1.2 |  |  | $1.8 \pm 0.1$ | $(2.6 \pm 0.1)^{\text {f }}$ |
|  |  |  |  |  | $1.7 \pm 0.2$ | $(2.3 \pm 0.3)^{f}$ |

${ }^{a}$ Temperature used in by the L-CID program is set to 473.15 K and the number of collisions used is $25000 .{ }^{6}$ FWHM stands for the full width at half of the maximum of the kinetic energy resolution determined from the retarding-potential analysis of a parent-ion intensity. ${ }^{\text {c }}$ Number of degrees of freedom. ${ }^{\text {d }}$ Number of free rotations. ${ }^{e}$ Binding energies determined by the L-CID program. ${ }^{\text {f }}$ Number is related to the energy necessary for the formation of iminium ion from the TMEDA ligand.

## General procedure for determination of the binding energies.

1. The collision-energy dependent relative cross sections were measured at least three times for each channel and average is used for further evaluation (open symbols in Figures below).
2. Each curve representing a relative fragmentation cross section determined in CID with argon has been first modeled by double Boltzmann sigmoid curve in order to suppress the experimental noise of the curves used for the L-CID fitting (red lines in Figures S1 - S7 below). The raw data were taken for the L-CID fitting determined in the CID experiment with xenon.
3. The smoothed curves were submitted for the L-CID fitting. Losses of both ligands were fitted at once as well as each separately (blue and green lines in Figures S1 - S7 below). In the case of the CID experiment with xenon, individual channels were fitted separately.

Figure S1. Relative cross sections for the $\mathrm{H}_{2} \mathrm{O}$ and PhO losses from the $\left[\mathrm{Cu}(\mathrm{PhO})\left(\mathrm{H}_{2} \mathrm{O}\right)\right]^{+}$complex upon collision with argon. The open symbols show averages of three measurements. The red lines show curves, which were submitted for the L-CID fitting. The blue curves show the result of parallel fitting of both fragmentation channels. The green lines show separate fittings of the fragmentation channels. The results of the fittings are written in the respective colors.

Figure S2. Relative cross sections for the $\mathrm{CH}_{3} \mathrm{OH}$ and PhO losses from the $\left[\mathrm{Cu}(\mathrm{PhO})\left(\mathrm{CH}_{3} \mathrm{OH}\right)\right]^{+}$complex upon collision with argon. The open symbols show averages of two measurements for the loss of methanol and four measurements for the loss of the phenoxy ligand. The red lines show curves, which were submitted for the L-CID fitting. The blue curves show the result of a parallel fitting of both fragmentation channels. The green dashed lines show separate fittings of the fragmentation channels. The results of the fittings are written in the respective colors.

Figure S3. Relative cross sections for the DME and PhO losses from the $[\mathrm{Cu}(\mathrm{PhO})(\mathrm{DME})]^{+}$complex upon collision with argon. The open symbols show averages of two measurements for the loss of PhO and three measurements for the loss of DME. The red lines show curves, which were submitted for the L-CID fitting. The blue curves show the result of a parallel fitting of both fragmentation channels. The green dashed lines show separate fittings of the fragmentation channels. The results of the fittings are written in the respective colors.

Figure S4. Relative cross sections for the $\mathrm{NH}_{3}$ and PhO losses from the $\left[\mathrm{Cu}(\mathrm{PhO})\left(\mathrm{NH}_{3}\right)\right]^{+}$complex upon collision with argon. The open symbols show averages of three measurements. The red lines show curves, which were submitted for the L-CID fitting. The blue curves show the result of a parallel fitting of both fragmentation channels. The green lines show separate fittings of the fragmentation channels. The results of the fittings are written in the respective colors.

Figure S5. Relative cross sections for the pyridine and PhO losses from the $[\mathrm{Cu}(\mathrm{PhO})(\mathrm{Py})]^{+}$complex upon collision with argon. The open symbols and black dotted lines show averages of four measurements. The red dotted lines show curves, which were submitted for the L-CID fitting. The blue curves show the result of parallel fitting of both fragmentation channels. The green lines show separate fittings of the fragmentation channel. The results of the fittings are written in the respective colors.

Figure S6. Relative cross sections for the imidazole and PhO losses from the $[\mathrm{Cu}(\mathrm{PhO})(\mathrm{Imi})]^{+}$complex upon collision with argon. The open symbols show averages of three measurements. The red lines show curves, which were submitted for the L-CID fitting. The blue curves show the result of parallel fitting of both fragmentation channels. The green lines show separate fittings of the fragmentation channels. The results of the fittings are written in the respective colors.

Figure S7. Relative cross sections for the ( PhO$) \mathrm{CuH}$ and PhO losses from the $[\mathrm{Cu}(\mathrm{PhO})(\mathrm{TMEDA})]^{+}$ complex upon collision with argon. The open symbols show an average of three measurements for the loss of ( PhO$) \mathrm{CuH}$ and a measurement for the loss of PhO . The red lines show curves, which were submitted for the L-CID fitting. The blue curves show the result of parallel fitting of both fragmentation channels. The green lines show separate fittings of the fragmentation channels. The results of the fittings are written in the respective colors.

Figure S8. Relative cross sections for the PhO (circle symbols) and L (rectangular symbols) losses from the $[\mathrm{Cu}(\mathrm{PhO})(\mathrm{L})]^{+}$complex upon collision with xenon; $\mathrm{L}=\mathrm{H}_{2} \mathrm{O}(\mathrm{a}), \mathrm{CH}_{3} \mathrm{OH}(\mathrm{b})$, THF (c), thiophene (d), DME (e), $\mathrm{NH}_{3}(\mathrm{f})$, pyrrole (g), pyridine (h), imidazole (i), and TMEDA (j). The blue lines show the result of the LCID fitting of the phenoxy-loss channel and the red lines are fits of the L-loss channel. Note that in the case of $[\mathrm{Cu}(\mathrm{PhO})(\mathrm{TMEDA})]^{+}$, the $[\mathrm{Cu}(\mathrm{PhO})(\mathrm{H})]$ is lost rather than TMEDA (in green color).

Table S2. Results of the L-CID fitting of the relative fragmentation cross sections of $[\mathrm{Cu}(\mathrm{PhO})(\mathrm{L})]^{+}$ ( $\mathrm{L}=\mathrm{H}_{2} \mathrm{O}, \mathrm{CH}_{3} \mathrm{OH}$, THF, thiophene, DME, $\mathrm{NH}_{3}$, pyrrole, pyridine, imidazole, and TMEDA) upon CID with xenon. The kinetic energy distribution of the parent ions was 1.2 eV (FWHM) ${ }^{\mathrm{a}}$ and temperature was set to 473.15 K ,

|  | $B D E(\mathrm{PhO})$ | $B D E(\mathrm{~L})$ | $n_{\text {eff }}(\mathrm{PhO})$ | $\mathrm{a}^{\prime}(\mathrm{PhO})$ | $n_{\text {eff }}(\mathrm{L})$ | $\mathrm{a}^{\prime}(\mathrm{L})$ | $\mathrm{N}_{\text {vib }}$ | $\mathrm{N}_{\text {rot }}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{H}_{2} \mathrm{O}$ | 2.6 | 1.3 | 647 | 6100 | 823 | 5740 | 42 | 3 |
| $\mathrm{CH}_{3} \mathrm{OH}$ | 2.3 | 1.5 | 548 | 6060 | 771 | 5740 | 51 | 4 |
| THF | 2.1 | 1.9 | 550 | 5860 | 926 | 5660 | 72 | 3 |
| Thiophene | 2.0 | 1.7 | 547 | 5380 | 873 | 5840 | 60 | 3 |
| DME | 1.7 | 2.1 | 974 | 5740 | 514 | 5300 | 81 | 4 |
| $\mathrm{NH}_{3}$ | 2.0 | 2.0 | 899 | 5780 | 751 | 5660 | 45 | 3 |
| Pyrrole | 1.9 | 2.1 | 928 | 5600 | 978 | 5980 | 63 | 3 |
| Pyridine | 2.1 | 2.3 | 578 | 6280 | 544 | 5480 | 66 | 3 |
| Imidazole | 2.1 | 2.5 | 744 | 6500 | 555 | 6380 | 60 | 3 |
| TMEDA | 1.8 | 2.6 | 562 | 5920 | 766 | 6260 | 105 | 6 |

${ }^{\text {a }}$ We have used the energy distribution of 1.2 eV as it is found in the experiment and did not enlarge it to 2 eV as for the fitting of experimental data from the experiment with argon. The effect is negligible.
