General Methods:

Unless stated otherwise, all reactions were carried out in flamedried glassware. All solvents were purified and dried according to standard methods prior to use. Morita-Baylis-Hillman carbonates **1** were prepared according to the literature.¹ Dialkyl phosphine oxides **2** were prepared according to the literature.² ^1H , ^{13}C and ^{31}P NMR spectra were recorded on a Varian instrument (300, 75 and 121 MHz, respectively) and internally referenced to tetramethylsilane signal or residual protio solvent signals. Data for ^1H NMR are recorded as follows: chemical shift (δ , ppm), multiplicity (s = singlet, d = doublet, t = triplet, m = multiplet, q = quartet or unresolved, coupling constant(s) in Hz, integration). Data for ^{13}C and ^{31}P NMR are reported in terms of chemical shift (δ , ppm). IR spectra were recorded on a FT-IR spectrometer and only major peaks were reported in cm^{-1} . Optical rotations were reported as follows: $[\alpha]_D^{rt}$ (c: g/100 mL, in solvent). Highresolution mass spectra (HRMS) were obtained by the ESI ionization sources. The ee value determination was carried out using chiral HPLC with Daicel Chiracel OD-H or AD column on Waters with a 996 UV-detector.

Experimental Procedures and Characterizations:

General Procedure A: Synthesis of **3a**.

To a solution of MBH carbonate **1a** (0.20 mmol), quinidine (0.04 mmol) and NaOH (0.30 mmol) in toluene (1.0 mL), diethyl phosphine oxide **2a** (0.50 mmol) was added at room temperature and stirred for 48 h. The reaction mixture was directly purified by silica gel chromatography without work up and fractions were collected and concentrated in vacuo to provide the pure desired product **3a**.

(Z)-methyl 2-((diethylphosphoryl)methyl)-3-phenylacrylate (**3a**)
