## I. General Methods, Materials, and Abbreviations

General Procedures. All chemicals were purchased from commercial suppliers and used without further purification. Analytical thin layer chromatography was carried out on pre-coated plates (silica gel $60 \mathrm{~F}_{254}, 250 \mu \mathrm{~m}$ thickness) and visualized with UV light. Flash chromatography was performed using 60 Á, 32-63 $\mu \mathrm{m}$ silica gel (Scientific Adsorbents). Concentration in vacuo refers to rotary evaporation under reduced pressure. ${ }^{1} \mathrm{H}$ NMR spectra were recorded at 300 MHz , 400 MHz , or 600 MHz at ambient temperature with Acetone- $d_{6}, \mathrm{DMSO}-d_{6}, \mathrm{CDCl}_{3}, \mathrm{CD}_{3} \mathrm{CN}$, or $\mathrm{CD}_{3} \mathrm{OD}$ as solvents. ${ }^{13} \mathrm{C}$ NMR spectra were recorded at $75 \mathrm{MHz}, 100 \mathrm{MHz}$, or 150 MHz at ambient temperature with Acetone- $d_{6}$, DMSO- $d_{6}$, CDCl $_{3}$, $\mathrm{CD}_{3} \mathrm{CN}$, or $\mathrm{CD}_{3} \mathrm{OD}$ as solvents. Chemical shifts are reported in parts per million (ppm) relative to the residual solvent peak. Infrared spectra were recorded on an ATI-FTIR spectrometer. The specifications of the LC/MS are as follows: electrospray (+) ionization, mass range 150-1500 Da, 20 V cone voltage, and Xterra® MS $\mathrm{C}_{18}$ column ( $2.1 \mathrm{~mm} \times 50 \mathrm{~mm}$ $\times 3.5 \mu \mathrm{~m}$ ). Preparative HPLC specifications are as follows: $15 \mathrm{~mL} / \mathrm{min}$ flow rate, Xterra Prep MS C 18 OBD column ( 19 mm x 100 mm ) and dual wavelength absorbance detector.

## II. Preparation of 2-(2-methylcyclohex-1-enyl)phenyl methanesulfonates

2-(2-methylcyclohex-1-enyl)phenyl methanesulfonate (7a). To a solution of 2-bromophenol ( 3.0 mL , $27.6 \mathrm{mmol})$ in diethyl ether ( 100 mL ) cooled to $0^{\circ} \mathrm{C}$ was added $n$-butyllithium ( 2.5 M in hexanes, 22 mL ). After stirring for 3 h , the solution was cooled to $-78{ }^{\circ} \mathrm{C}$ and 2-methylcyclohexanone ( $3.7 \mathrm{~mL}, 30.4 \mathrm{mmol}$ ) was added. The reaction was slowly warmed to $23{ }^{\circ} \mathrm{C}$ over 12 h . The mixture was cooled to $0^{\circ} \mathrm{C}$ and concentrated hydrochloric acid ( 12 mL ) was added. After stirring for 1 hour, water ( 10 mL ) was added. The layers were separated and the organic layer washed with water, 1 N aqueous sodium hydroxide, saturated aqueous ammonium chloride, brine, dried over sodium sulfate, filtered, and concentrated in vacuo yielding the mixture of $\mathbf{1 a}: 1 \mathrm{ib}$ isomers, a clear oil ( $4.6 \mathrm{~g}, 88 \%$ ).

To mesyl protect, the mixture of isomers ( $\mathbf{1 a / b}, 4.6 \mathrm{~g}, 24.5 \mathrm{mmol}$ ) and $\mathrm{Et}_{3} \mathrm{~N}(7.1 \mathrm{~mL}, 51.4 \mathrm{mmol})$ were dissolved in DCM ( 50 mL ) and cooled to $0^{\circ} \mathrm{C}$. Mesyl chloride ( $3.8 \mathrm{~mL}, 49.0 \mathrm{mmol}$ ) was slowly added over 5 min. Upon complete addition, the ice bath was removed and stirred at $20^{\circ} \mathrm{C}$ for 2 h under TLC control. After the phenolic starting material was consumed, water ( 15 mL ) was added. The layers were separated and the aqueous layer extracted with additional DCM. The combined organics were washed with brine, dried over sodium sulfate and concentrated in vacuo. The residue was purified by a plug flash chromatography (10-15\% ethyl acetate in hexanes) yielding the inseparable mixture of $7 \mathbf{7 a : 7 b}$, a clear oil ( $6.4 \mathrm{~g}, 98 \%$ ). Crude ${ }^{1} \mathrm{H}$-NMR spectra before and after isomerization with diagnostic peak assignment of 7a and 7b can be found at the end of NMR Section (X).

To isomerize this mixture, $7 \mathrm{a} / \mathrm{b}(3.75 \mathrm{~g}, 14.2 \mathrm{mmol})$ was dissolved in DCE ( 30 mL ). $\mathrm{PdCl}_{2}(250 \mathrm{mg}, 1.42 \mathrm{mmol})$ and $\mathrm{FeCl}_{3}(230 \mathrm{mg}, 1.42 \mathrm{mmol})$ were added and the mixture warmed to $60^{\circ} \mathrm{C}$. While the isomerization was complete in most cases within 8 h , the mixture was often stirred overnight (12-18 h). The mixture was concentrated in vacuo and purified by flash chromatography ( $12 \%$ ethyl acetate in hexanes) yielding only 7 a , a clear oil ( $3.48 \mathrm{~g}, 92 \%$ ). ## IX. Computational Details

All calculations were performed with GAUSSIANO3. Structures were optimized without symmetry constraints using the B3LYP/6-31+G(d,p) level of theory. Frequency analyses at the same level were used to confirm each structure as a minimum. Reported energies are computed free energies including unscaled zero-point energy corrections. Structural drawings were produced using Ball\&Stick.
