## General Information.

Diethyl ether and THF were freshly distilled from benzophenone ketyl radical under nitrogen prior to use. Dichloromethane was dried using a calcium hydride stills and $N, N-$ dimethylethylamine was distilled from calcium hydride under nitrogen. ${ }^{1}$ Tri- $n$-butylphosphine, ( $R$ )-BINAPHANE, lithium iodide, benzaldehyde, 2-chlorobenzaldehyde, 4-chlorobenzaldehyde 4-nitrobenzaldehyde, pentanal, hydrocinnamaldehyde, cinnamaldehyde, potassium hydroxide and sodium azide were purchased from Aldrich Chemical Co. Iatrobeads (Bioscan, 6RS-8060, $60 \mu \mathrm{M}$ particle size). TLC plates (Sorbent Technologies, UV254, $250 \mu \mathrm{M}$ ) were used as received. Methylphenylketene, ethylphenylketene, $n$-butylphenylketene, methyl-4-tolylketene, methyl-2tolylketene diphenylketene, and ethyl- $N$-methylindolylketene were prepared according to literature procedures. ${ }^{2-4}$

NMR spectra were recorded on Bruker DPX Avance 200 spectrometer ( 200 MHz for ${ }^{1} \mathrm{H}$ and 50 MHz for ${ }^{13} \mathrm{C}$ ) and on Bruker Biospin AG 400 spectrometer ( 400 MHz for ${ }^{1} \mathrm{H}$ and 100 MHz for ${ }^{13} \mathrm{C}$ ). NMR chemical shifts were reported relative to TMS ( 0 ppm ) for ${ }^{1} \mathrm{H}$ and to $\mathrm{CDCl}_{3}$ ( 77.23 ppm ) for ${ }^{13} \mathrm{C}$ spectra. High resolution mass spectra were obtained from the College of Sciences Major Instrumentation Cluster at Old Dominion University. Optical rotations were measured on Rudolph DigiPol 781 TDV automatic polarimeter. IR spectra were recorded on a Bio Rad FTS-175C spectrometer.

Analytical high performance liquid chromatography (HPLC) was performed using a Daicel Chiralpak AD column ( $0.46 \mathrm{~cm} \times 25 \mathrm{~cm}$ ) and an AS-H column ( $0.46 \mathrm{~cm} \times 25 \mathrm{~cm}$ ) (Daicel Chemical Ind., Ltd.) on a Perkin Elmer 235C instrument attached with diode array detector (deuterium lamp, 190-600 nm) with HPLC-grade isopropanol and hexanes as the eluting solvents.

Compound Characterization and Determination of Diastereomeric Ratios and Enantiomeric Excesses: Most of the $\beta$-lactones $\mathbf{3}$ appear to be unstable during attempted flash column chromatographic purification. The phosphine catalyst was removed by passing a dilute solution of the reaction mixture through a plug column of neutral silica (see procedure $\mathbf{A}$ ), without causing decomposition of the $\beta$-lactones 3 (obtained in $70-99 \%$ purity). In order to provide characterization data for all compounds, the impure $\beta$-lactones ( $<95 \%$ purity) were converted into the corresponding stable $\beta$-hydroxyacids 4 by treatment with aqueous KOH in THF. The $\beta$-hydroxyacids 4 were purified by flash column chromatography to provide pure samples for full characterization (see procedure B). Diastereomeric ratios were determined for the crude $\beta$-lactones 3a-n either by integrating the tertiary $\mathbf{C} \underline{\mathbf{H}}$ resonances in ${ }^{1} \mathrm{H}$ NMR or by comparing the peak areas of HPLC data. Enantiomeric excesses were determined by assaying the crude $\beta$-lactones 3a-n using chiral HPLC analysis (at $\lambda=225 \mathrm{~nm}$; details given for each compound). Authentic racemic samples for chiral HPLC analysis were generated through the $\mathrm{PBu}_{3}$-catalyzed reaction (Procedure A).

Procedure A for $\boldsymbol{\beta}$-lactone synthesis: To a stirring solution of aldehyde ( $0.34-1.02 \mathrm{mmol}, 1.0-$ 3.0 equiv.) and phosphine catalyst ( $\mathrm{PBu}_{3}$ or BINAPHANE) ( $0.034 \mathrm{mmol}, 0.1$ equiv.) in dichloromethane ( 0.40 mL ) at $-78{ }^{\circ} \mathrm{C}$ under nitrogen atmosphere, was added a solution of ketoketene ( $0.34 \mathrm{mmol}, 1.0$ equiv.) in dichloromethane ( 0.40 mL ) [overall ketene concentration $0.43 \mathrm{M}]$ over a period of 4 h using syringe pump and stirring was continued at $-78^{\circ} \mathrm{C}$. After 4 h , the reaction was allowed to warm up to room temperature gradually over 4 h in the cooling bath (total reaction time $=12 \mathrm{~h})$. The reaction was then quenched by addition of dilute $\mathrm{H}_{2} \mathrm{O}_{2}(0.002$ $\mathrm{mL}, 0.038 \mathrm{mmol}, 0.1$ equiv), diluted with $10 \% \mathrm{EtOAc} / \mathrm{hexane}(10 \mathrm{~mL})$ and dichloromethane ( 2.5 mL ) [for $\sim 100 \mathrm{mg}$ reaction mixture] and the crude solution was passed through a plug column of
neutral silica (iatrobeads, $2 \times 2 \mathrm{~cm}, 5 \mathrm{~g}$ ) [ 50 x reaction mixture]. The plug column was eluted with $10 \% \mathrm{EtOAc} / \mathrm{Hexane}$ solvent system $(100 \mathrm{~mL})$, and the solvent was removed under vacuum to furnish the desired $\beta$-lactone 3a-n with $70->99 \%$ purity (as determined by GC-MS or ${ }^{1} \mathrm{H}$ NMR analysis).

Procedure B for $\boldsymbol{\beta}$-hydroxyacid synthesis: A stirring mixture of $\beta$-lactone $\mathbf{3}(0.30 \mathrm{mmol}, 1.0$ equiv.) and aqueous $\mathrm{KOH}(1.0 \mathrm{~N} ; 0.60 \mathrm{~mL}, 0.60 \mathrm{mmol}, 2.0$ equiv.) in THF ( 1.2 mL ) was heated to $60^{\circ} \mathrm{C}$ in a sealed tube for 6-12 h. After cooling, the reaction mixture was diluted with water ( 2 mL ), extracted with dichloromethane ( 30 mL ) to remove undesired product. The aqueous layer was acidified with $\mathrm{HCl}(10 \%)$, extracted with dichloromethane ( $20 \mathrm{~mL} \times 3$ ) and combined extracts were washed with brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Removal of the solvent under vacuum followed by column chromatographic purification using hexane/EtOAc solvent system furnished the desired $\beta$-hydroxyacid. Isolated yields are determined for two steps from the relevant ketoketene.

(3R,4R)-4-(4-Chlorophenyl)-3-ethyl-3-phenyloxetan-2-one (3a): Following procedure A, ethylphenylketene ( 51 mg , 0.35 mmol ) was added to 4 chlorobenzaldehyde (49 mg, 0.35 mmol ) and ( $R$ )BINAPHANE ( $25 \mathrm{mg}, 0.035$ mmol). 3a was obtained as a colorless oil ( 94 mg , $94 \%$ yield, $96 \%$ purity by ${ }^{1} \mathrm{H}$ NMR), dr 93:7 (by HPLC); HPLC analysis: $64 \%$ ee [Daicel Chiralpak AS-H column; $0.5 \mathrm{~mL} / \mathrm{min}$; solvent system: $10 \%$ isopropanol in hexane; retention times: 11.6 min (major), 16.7 min (minor)]; $[\alpha]_{D}^{24}$ $=-34.0\left(\mathrm{c}=0.10, \mathrm{CHCl}_{3}\right)$; IR (thin film): 2933, 1827, $1092 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$, TMS) $\delta 7.40-7.28(\mathrm{~m}, 9 \mathrm{H}), 5.58(\mathrm{~s}, 1 \mathrm{H}), 1.70-1.61(\mathrm{~m}, 1 \mathrm{H}), 1.45-1.18(\mathrm{~m}, 1 \mathrm{H}), 0.58(\mathrm{t}, J=6.0$ $\mathrm{Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 171.8,137.5,135.0,133.6,129.3,129.3,128.2,127.4$, $126.5,82.3,68.8,27.4,8.5$; MS (EI 70 eV ) m/z 242, 227, 192. Satisfactory HRMS data was not obtained for $\mathbf{3 a}$, so it was converted to $\mathbf{4 a}$ to provide full characterization data.
(2R)-2-((R)-(4-Chlorophenyl)hydroxymethyl)-2-phenylbutanoic acid (4a): Procedure B was followed employing 3a ( $94 \mathrm{mg}, 96 \%$ purity), aqueous $\mathrm{KOH}(0.63 \mathrm{~mL}, 0.63 \mathrm{mmol})$ and a reaction time of 6 hours. Elution with $25 \% \mathrm{EtOAc} / \mathrm{hexane}$ followed by solvent removal under reduced pressure yielded $4 \mathbf{4}$ as a white gum ( $93 \mathrm{mg}, 87 \%$ yield for two steps), dr 93:7 (by HPLC); $[\alpha]_{D}^{22}$ $=-38.0\left(\mathrm{c}=0.53, \mathrm{CHCl}_{3}\right)$; IR (thin film): 2964, 2935, $1700 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, TMS) $\delta 7.27-7.22(\mathrm{~m}, 3 \mathrm{H}), 7.06-7.02(\mathrm{~m}, 4 \mathrm{H}), 6.74-6.72(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 5.26(\mathrm{~s}, 1 \mathrm{H}), 2.11-$ $2.02(\mathrm{~m}, 1 \mathrm{H}), 1.90-1.80(\mathrm{~m}, 1 \mathrm{H}), 0.98(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 179.9$, 138.4, 137.2, 133.9, 129.2, 128.6, 128.1, 127.9, 127.9, 78.5, 60.7, 25.0, 10.1; (M+Na) HRMS $\mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{17} \mathrm{H}_{17} \mathrm{ClO}_{3} \mathrm{Na}$ : 327.0758; Found: 327.0759.

## Determination of trans Relative Stereochemistry:

X-Ray Crystal Structure for Compound ( $\pm$ )-3d

( $\pm$ ) - 3 d

A colorless solution of crude ( $\pm$ )-3d in acetone/hexane (1:4) was prepared. Crystals suitable for X-ray structure analysis were obtained from this on standing.
A clear colourless plate-like specimen of $\mathrm{C}_{16} \mathrm{H}_{13} \mathrm{NO}_{4}$, approximate dimensions $0.09 \mathrm{~mm} \times 0.13$ $\mathrm{mm} \times 0.33 \mathrm{~mm}$, was used for the X-ray crystallographic analysis. The X-ray intensity data were measured.
A total of 2668 frames were collected. The total exposure time was 7.41 hours. The frames were integrated with the Bruker SAINT software package using a narrow-frame algorithm. The integration of the data using an orthorhombic unit cell yielded a total of 14868 reflections to a maximum $\theta$ angle of $68.19^{\circ}$ ( $0.83 \AA$ resolution), of which 2392 were independent (average redundancy 6.216 , completeness $=97.0 \%, \mathrm{R}_{\text {int }}=4.82 \%, \mathrm{R}_{\text {sig }}=3.01 \%$ ) and 1843 (77.05\%) were greater than $2 \sigma\left(\mathrm{~F}^{2}\right)$. The final cell constants of $\underline{\mathrm{a}}=24.6054(4) \AA, \underline{\mathrm{b}}=7.01010(10) \AA \mathrm{A}, \underline{\mathrm{c}}=$ $15.5516(2) \AA$, volume $=2682.44(7) \AA^{3}$, are based upon the refinement of the XYZ-centroids of 1166 reflections above $20 \sigma(\mathrm{I})$ with $7.183^{\circ}<2 \theta<130.0^{\circ}$. Data were corrected for absorption effects using the multi-scan method (SADABS). The ratio of minimum to maximum apparent transmission was 0.781 . The calculated minimum and maximum transmission coefficients (based on crystal size) are 0.7665 and 0.9278 .
The structure was solved and refined using the Bruker SHELXTL Software Package, using the space group $\mathrm{P} \mathrm{c} \mathrm{c} \mathrm{n} \mathrm{with} \mathrm{Z}=$,8 for the formula unit, $\mathrm{C}_{16} \mathrm{H}_{13} \mathrm{NO}_{4}$. The final anisotropic full-matrix least-squares refinement on $\mathrm{F}^{2}$ with 191 variables converged at $\mathrm{R} 1=3.91 \%$, for the observed data and $\mathrm{wR} 2=10.37 \%$ for all data. The goodness-of-fit was 1.042. The largest peak in the final difference electron density synthesis was $0.229 \mathrm{e}^{-} / \AA^{3}$ and the largest hole was $-0.222 \mathrm{e}^{-} / \AA^{3}$ with an RMS deviation of $0.042 \mathrm{e}^{-} / \AA^{3}$. On the basis of the final model, the calculated density was $1.403 \mathrm{~g} / \mathrm{cm}^{3}$ and $F(000), 1184 \mathrm{e}^{-}$.

## Determination of Absolute Stereochemistry:

## X-Ray Crystal Structure for Compound 3n

3n

A colorless solution of crude $\mathbf{3 n}$ in EtOAc/hexane (2:3) was prepared. Crystals suitable for X-ray structure analysis were obtained from this on standing.
A clear colourless rod-like specimen of $\mathrm{C}_{21} \mathrm{H}_{15} \mathrm{NO}_{4}$, approximate dimensions $0.28 \mathrm{~mm} \times 0.34$ $\mathrm{mm} \times 0.39 \mathrm{~mm}$, was used for the X-ray crystallographic analysis. The X-ray intensity data were measured.
A total of 3681 frames were collected. The total exposure time was 5.11 hours. The frames were integrated with the Bruker SAINT software package using a narrow-frame algorithm. The integration of the data using an orthorhombic unit cell yielded a total of 24408 reflections to a maximum $\theta$ angle of $71.71^{\circ}$ ( $0.81 \AA$ resolution), of which 3296 were independent (average redundancy 7.405 , completeness $\left.=99.9 \%, \mathrm{R}_{\text {int }}=2.49 \%, \mathrm{R}_{\text {sig }}=1.36 \%\right)$ and $3213(97.48 \%)$ were greater than $2 \sigma\left(\mathrm{~F}^{2}\right)$. The final cell constants of $\underline{\mathrm{a}}=9.51250(10) \AA, \underline{\mathrm{b}}=10.85260(10) \AA, \underline{\mathrm{c}}=$ $16.4229(2) \AA$, volume $=1695.42(3) \AA^{3}$, are based upon the refinement of the XYZ-centroids of 7955 reflections above $20 \sigma(\mathrm{I})$ with $8.146^{\circ}<2 \theta<142.1^{\circ}$. Data were corrected for absorption effects using the multi-scan method (SADABS). The ratio of minimum to maximum apparent transmission was 0.877 . The calculated minimum and maximum transmission coefficients (based on crystal size) are 0.7534 and 0.8127 .

The structure was solved and refined using the Bruker SHELXTL Software Package, using the space group P 212121 , with $\mathrm{Z}=4$ for the formula unit, $\mathrm{C}_{21} \mathrm{H}_{15} \mathrm{NO}_{4}$. The final anisotropic fullmatrix least-squares refinement on $\mathrm{F}^{2}$ with 236 variables converged at $\mathrm{R} 1=2.66 \%$, for the observed data and $\mathrm{wR} 2=6.94 \%$ for all data. The goodness-of-fit was 1.065. The largest peak in the final difference electron density synthesis was $0.174 \mathrm{e}^{-} / \AA^{3}$ and the largest hole was $-0.176 \mathrm{e}^{-}$ $/ \AA^{3}$ with an RMS deviation of $0.037 \mathrm{e}^{-} / \AA^{3}$. On the basis of the final model, the calculated density was $1.353 \mathrm{~g} / \mathrm{cm}^{3}$ and $F(000), 720 \mathrm{e}^{-}$.
