1.4 Methods for kinetic studies. For all cases, the kinetics of both the decrease of the reactants and the increase of the products were measured, and found to be in good agreement.

The kinetics of the decrease of the reactants was analyzed according to the following equations:

$$
\begin{aligned}
& \operatorname{Ln}\left([\mathrm{A}] /[\mathrm{A}]_{0}\right)=\mathrm{kt} \\
& {[\mathrm{~A}] /[\mathrm{A}]_{0}=\mathrm{I}_{\text {normalized }} / \mathrm{I}_{0, \text { normalized }}} \\
& \mathrm{I}_{\text {normalized }}=\mathrm{I}^{*} / \mathrm{I}_{\text {std }} \\
& \mathrm{I}_{0, \text { normalized }}=\mathrm{I}_{0} / \mathrm{I}_{\text {std }}
\end{aligned}
$$

$I^{*}$ is the intensity of the peak of interest, for example, the $\mathrm{Pd} M e$ resonance for insertion studies and the $\mathrm{PdCMe} e_{2}$ resonance for $\beta$-OR elimination studies. In some cases the integration of the $\mathrm{OCH}_{2} \mathrm{CH}_{3}$ resonance of $\mathrm{OEt}_{2}$ was used as $\mathrm{I}_{\text {std }}$. If peaks from other species overlapped
with the $\mathrm{OCH}_{2} \mathrm{CH}_{3}$ resonance we used the whole aromatic region as $\mathrm{I}_{\text {std }}$. For the reaction of $\mathbf{1}\left[\mathrm{SbF}_{6}\right]$ with $\mathbf{2 f}$, we analyzed the results by using both $\mathrm{OCH}_{2} \mathrm{CH}_{3}$ resonance from $\mathrm{OEt}_{2}$ and the whole aromatic region as $\mathrm{I}_{\text {std }}$, which gave the same results.

The kinetics of the increase of the products was analyzed according to the following equations:

$$
\begin{aligned}
& \operatorname{Ln}\left[\left([\mathrm{B}]_{\infty}-[\mathrm{B}]\right) /\left([\mathrm{B}]_{\infty}-[\mathrm{B}]_{0}\right)\right]=\mathrm{kt} \\
& \left([\mathrm{~B}]_{\infty}-[\mathrm{B}]\right) /\left([\mathrm{B}]_{\infty}-[\mathrm{B}]_{0}\right)=\left(\mathrm{I}_{\infty, \text { normalized }}-\mathrm{I}^{*}\right) /\left(\mathrm{I}_{\infty, \text { normalized }}-\mathrm{I}_{0, \text { normalized }}\right) \\
& \mathrm{I}_{\text {normalized }}=\mathrm{I}^{*} / \mathrm{I}_{\text {std }} \\
& \mathrm{I}_{0, \text { normalized }}=\mathrm{I}_{0} / \mathrm{I}_{\text {std }}
\end{aligned}
$$

I* is the intensity of the peak of interest, for example, the $\mathrm{PdCMe}_{2}$ and $\mathrm{PdCH}_{2} \mathrm{CH}(\mathrm{OEt}) \mathrm{Me}$ resonances for insertion studies and the $\operatorname{Pd}\left(\eta^{3}-\mathrm{CH}_{2} \mathrm{CHCH}_{2}\right)$ resonance for $\beta$-OR elimination studies. Specifically, for the case of $\mathrm{CH}_{2}=\mathrm{CHOEt}$ and $\mathrm{CH}_{2}=\mathrm{CHOPh}$, in which the $\beta$-OR elimination rate is comparable with the insertion rate, we used the sum of $\mathrm{PdCMe}_{2}$, $\mathrm{PdCH}_{2} \mathrm{CH}(\mathrm{OEt}) \mathrm{Me}$ and $\mathrm{Pd}\left(\eta^{3}-\mathrm{CH}_{2} \mathrm{CHCH}_{2}\right)$ resonances as the I* for insertion kinetics. Kinetic data and plots are shown in Sections 5, 6 and 7; representative NMR spectra from kinetic studies are shown in Section 10.

## 2. Cationic Polymerization of 2a,c and Characterization of Poly(vinyl ether).

### 2.1 Cationic polymerization of $\mathrm{CH}_{2}=\mathrm{CHO}^{t} \mathrm{Bu}(2 \mathrm{a})$ by $\left[\mathrm{Li}\left(\mathrm{Et}_{2} \mathrm{O}\right)_{2.8}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$. An

 NMR tube was charged with $\left[\mathrm{Li}\left(\mathrm{Et}_{2} \mathrm{O}\right)_{2.8}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right](22.7 \mathrm{mg}, 0.0254 \mathrm{mmol}) . \mathrm{CD}_{2} \mathrm{Cl}_{2}(0.4$ mL ) was added by vacuum transfer at $-196^{\circ} \mathrm{C}$. The tube was warmed to $20^{\circ} \mathrm{C}$ and shaken. 2a $(1.25 \mathrm{mmol})$ was added by vacuum transfer at $-196^{\circ} \mathrm{C}$. The tube was warmed to $20^{\circ} \mathrm{C}$, shaken vigorously, and monitored periodically by NMR. ${ }^{1} \mathrm{H}$ NMR spectra showed that 2a wasquantitatively converted to polymer after $20 \mathrm{~h} .2,6$-di-tert-butylpyridine significantly retards the polymerization of 2a by $\left[\mathrm{Li}\left(\mathrm{Et}_{2} \mathrm{O}\right)_{2.8}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$.
2.2 Cationic polymerization of $\mathrm{CH}_{2}=\mathrm{CHO}^{t} \mathrm{Bu}(2 a)$ by $\left[\mathrm{Ph}_{3} \mathbf{C}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathbf{F}_{5}\right)_{4}\right]$. An NMR tube was charged with $\left[\mathrm{Ph}_{3} \mathrm{C}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right](24.5 \mathrm{mg}, 0.0266 \mathrm{mmol}) . \mathrm{CDCl}_{3}(0.4 \mathrm{~mL})$ was added by vacuum transfer at $-196^{\circ} \mathrm{C}$. The tube was warmed to $20^{\circ} \mathrm{C}$ and shaken. 2a ( 1.25 mmol ) was added by vacuum transfer at $-196^{\circ} \mathrm{C}$. The tube was warmed to $20^{\circ} \mathrm{C}$, shaken vigorously, and monitored periodically by NMR. ${ }^{1}$ H NMR spectra showed that 2a was quantitatively converted to polymer after 20 h .
2.3 Polymerization of $\mathbf{C H}_{2}=\mathbf{C H O S i M e}_{3}(2 \mathrm{c})$ by $\mathbf{1}\left[\mathbf{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$. A Schlenk flask was charged with ( $\alpha$-diimine $) \mathrm{PdMeCl}(11.4 \mathrm{mg}, 0.0203 \mathrm{mmol})$ and $\left.\left[\mathrm{Li}^{( } \mathrm{Et}_{2} \mathrm{O}\right)_{2.8}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right](17.6$ $\mathrm{mg}, 0.0197 \mathrm{mmol}) . \mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ was added by syringe. The mixture was stirred vigorously at $20^{\circ} \mathrm{C}$ for 10 min . A solution of $\mathbf{2 c}(400 \mathrm{mg}, 3.33 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(9 \mathrm{~mL})$ was added by cannula. The mixture became dark within 10 min , indicating the formation of $\mathrm{Pd}^{0}$. After 20 h , the volatiles were removed under vacuum, affording dark oil. NMR analysis showed that the oil contained poly(trimethylsilyl vinyl ether) $\left(-\left[\mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{OSiMe}_{3}\right)\right]_{\mathrm{n}}-\right)$, free $\alpha$-diimine and other unidentified species. Approximately $7 \%$ of 2c was converted to polymer. 2,6-di-tert-butylpyridine does not significantly affect the polymerization of $\mathbf{2 c}$ by $1\left[\mathrm{~B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$.
2.4 Attempted polymerization of $\mathbf{C H}_{\mathbf{2}}=\mathbf{C H O S i P h}_{3}$ by $\mathbf{1}\left[\mathbf{B}\left(\mathbf{C}_{6} \mathbf{F}_{5}\right)_{4}\right]$. An NMR tube was charged with ( $\alpha$-diimine) $\mathrm{PdMeCl}(5.5 \mathrm{mg}, 0.010 \mathrm{mmol}),\left[\mathrm{Li}\left(\mathrm{Et}_{2} \mathrm{O}\right)_{2.8}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right](8.3$ $\mathrm{mg}, 0.0093 \mathrm{mmol})$ and $\mathrm{CH}_{2}=\mathrm{CHOSiPh}_{3}(176 \mathrm{mg}, 0.582 \mathrm{mmol}) . \mathrm{CD}_{2} \mathrm{Cl}_{2}(0.4 \mathrm{~mL})$ was added
by vacuum transfer at $-196^{\circ} \mathrm{C}$. The tube was warmed to $20^{\circ} \mathrm{C}$, shaken and monitored by ${ }^{1} \mathrm{H}$ NMR periodically. NMR spectra showed that no polymer had formed after 20 h .
2.5 Attempted polymerization of $\mathbf{C H}_{\mathbf{2}}=\mathbf{C H O P h}$ by $\mathbf{1}\left[\mathbf{B}\left(\mathbf{C}_{6} \mathbf{F}_{5}\right)_{4}\right]$. An NMR tube was charged with ( $\alpha$-diimine) $\mathrm{PdMeCl}(8.4 \mathrm{mg}, 0.015 \mathrm{mmol}),\left[\mathrm{Li}\left(\mathrm{Et}_{2} \mathrm{O}\right)_{2.8}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right](13.4 \mathrm{mg}$, 0.0150 mmol ) and $\mathrm{CH}_{2}=\mathrm{CHOPh}(33 \mathrm{mg}, 0.27 \mathrm{mmol}) . \mathrm{CD}_{2} \mathrm{Cl}_{2}(0.4 \mathrm{~mL})$ was added by vacuum transfer at $-196{ }^{\circ} \mathrm{C}$. The tube was warmed to $20{ }^{\circ} \mathrm{C}$, shaken, and monitored by ${ }^{1} \mathrm{H}$ NMR periodically. NMR spectra showed that no polymer had formed after 20 h .

### 2.6 Cationic polymerization of $\mathrm{CH}_{2}=\mathrm{CHOSiMe}_{3}(2 \mathrm{c})$ by $\left[\mathrm{Li}\left(\mathrm{Et}_{2} \mathrm{O}\right)_{2.8}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$. A

 Schlenk flask was charged with $\left[\mathrm{Li}\left(\mathrm{Et}_{2} \mathrm{O}\right)_{2.8}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right](17.8 \mathrm{mg}, 0.0199 \mathrm{mmol})$. A solution of 2c ( $320 \mathrm{mg}, 2.67 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ was added by cannula and the mixture was stirred vigorously at $20^{\circ} \mathrm{C}$. After 20 h , the volatiles were removed under vacuum. The nonvolatile oily residue was dried under vacuum to yield a white oil ( 120 mg ), which was identified as poly(trimethylsilyl vinyl ether) $\left(-\left[\mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{OSiMe}_{3}\right)\right]_{\mathrm{n}}-\right)$ by NMR.2.7 Cationic polymerization of $\mathrm{CH}_{2}=\mathrm{CHOSiMe}_{3}(2 \mathrm{c})$ by $\left[\mathrm{Ph}_{3} \mathrm{C}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$. A flask was charged with $\left[\mathrm{Ph}_{3} \mathrm{C}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$ ( $24.4 \mathrm{mg}, 0.0265 \mathrm{mmol}$ ) and cooled to $-196{ }^{\circ} \mathrm{C}$. Chlorobenzene ( 1.2 mL ) was added by vacuum transfer. The mixture was warmed to $23^{\circ} \mathrm{C}$. A Schlenk tube was charged with chlorobenzene or toluene ( 1.2 mL ) and cooled to $-196^{\circ} \mathrm{C} .2 \mathbf{c}$ ( $1.50 \mathrm{~mL}, 1.17 \mathrm{~g}, 375$ equiv) was added by vacuum transfer. The Schlenk tube was warmed to $-40^{\circ} \mathrm{C}$ with a dry ice/acetonitrile bath. The catalyst solution (at $23{ }^{\circ} \mathrm{C}$ ) was transferred by cannula to the Schlenk tube. The mixture was stirred for 2 h at $-40^{\circ} \mathrm{C}$ and then quenched with methanol ( 1 mL ) pre-cooled to $-40{ }^{\circ} \mathrm{C}$. Immediate gellation occurred upon the addition of
methanol. The mixture was transferred to a flask containing methanol ( 75 mL ) and the mixture was stirred for 7.5 h . The white solid precipitate was collected by filtration, washed with methanol, dried under vacuum, and identified as poly(vinyl alcohol). ${ }^{1}$ For reaction in chlorobenzene: yield 339 mg ( $76 \%$ ), $\mathrm{M}_{n} 4000$. For reaction in toluene: yield 429 mg ( $97 \%$ ), $\mathrm{M}_{n} 7000$.

## 4. Competitive Binding Studies.

4.1 Competitive binding of $2 \mathrm{~d}-\mathrm{g}$ and 2 c to $1\left[\mathrm{SbF}_{6}\right]$ at $-20^{\circ} \mathrm{C}$ (eq 5). The procedure for $\mathbf{2 d}$ is described here; an identical procedure was used for $\mathbf{2 e} \mathbf{e}$. An NMR tube was charged with $\mathbf{1}\left[\mathrm{SbF}_{6}\right](15.0 \mathrm{mg}, 0.0179 \mathrm{mmol})$ and $\mathbf{2 d}(31.0 \mathrm{mg}, 0.258 \mathrm{mmol}) . \mathrm{CD}_{2} \mathrm{Cl}_{2}(0.4 \mathrm{~mL})$ and $\mathbf{2 c}$ ( 0.034 mmol ) were added by vacuum transfer at $-196^{\circ} \mathrm{C}$. The tube was warmed to $-78{ }^{\circ} \mathrm{C}$, shaken and placed in an NMR probe that had been pre-cooled to $-20^{\circ} \mathrm{C}$. The reaction was monitored periodically by ${ }^{1} \mathrm{H}$ NMR at $-20^{\circ} \mathrm{C}$ until after 30 min , when the reaction quotient $\mathrm{Q}_{\mathbf{2 e} / 2 \mathbf{c}}=[\mathbf{3 d}][\mathbf{2 c}][\mathbf{3 c}]^{-1}[\mathbf{2 d}]^{-1}$ reached a constant value. Additional $\mathbf{2 d}(0.14 \mathrm{mmol})$ was added by
vacuum transfer to change the $\mathbf{2 c} / \mathbf{2 d}$ ratio, and the tube was monitored by ${ }^{1} \mathrm{H}$ NMR at $-20{ }^{\circ} \mathrm{C}$ until $\mathrm{Q}_{2 \mathrm{~d} / 2 \mathrm{c}}$ again reached a constant value. The process was repeated one more time and the average $K_{2 \mathrm{~d} / 2 \mathrm{c}}$ value is reported in Table 2 of the text.
4.2 Competitive binding of ethylene and $\mathrm{CH}_{2}=\mathbf{C H O R}(2 \mathrm{a}-\mathrm{c}, 2 \mathrm{~g})$ to $1\left[\mathrm{~B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$ at $-60{ }^{\circ} \mathbf{C}$ (eq 4). The procedure for $\mathbf{2 a}$ is described here; an identical procedure was used for $\mathbf{2 b}$, $\mathbf{2 c}, \mathbf{2 f}, \mathbf{2 g}$. An NMR tube was charged with ( $\alpha$-diimine) $\mathrm{PdMeCl}(11.2 \mathrm{mg}, 0.0199 \mathrm{mmol})$ and $\left[\mathrm{Li}\left(\mathrm{Et}_{2} \mathrm{O}\right)_{2.8}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right](17.5 \mathrm{mg}, 0.0196 \mathrm{mmol}) . \mathrm{CD}_{2} \mathrm{Cl}_{2}(0.4 \mathrm{~mL})$ was added by vacuum transfer at $-196^{\circ} \mathrm{C}$. The tube was warmed to $20^{\circ} \mathrm{C}$ and shaken. Ethylene ( 0.062 mmol ) and 2a ( 0.040 mmol ) were added by vacuum transfer at $-196^{\circ} \mathrm{C}$. The tube was warmed to $-78{ }^{\circ} \mathrm{C}$, shaken, and placed in an NMR probe that had been pre-cooled to $-60^{\circ} \mathrm{C}$. The reaction was monitored periodically by ${ }^{1} \mathrm{H}$ NMR at $-60{ }^{\circ} \mathrm{C}$ until after 1 h , when the reaction quotient $\mathrm{Q}_{\text {2a/ethylene }}=[\mathbf{3 a}]\left[\mathrm{CH}_{2}=\mathrm{CH}_{2}\right]\left[(\alpha \text {-diimine }) \mathrm{PdMe}\left(\mathrm{CH}_{2}=\mathrm{CH}_{2}\right)^{+}\right]^{-1}[\mathbf{2 a}]^{-1}$ reached a constant value. Additional 2a ( 0.062 mmol ) was added by vacuum transfer to change the ethylene $/ \mathbf{2 a}$ ratio, and the tube was monitored by ${ }^{1} \mathrm{H}$ NMR at $-60{ }^{\circ} \mathrm{C}$ until $\mathrm{Q}_{2 \text { aethylene }}$ reached a constant value again.

6.3 Reaction of $\mathbf{5 c}\left[\mathbf{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$ with $\mathbf{M e C N}$. 6.8 Reaction of $1\left[B\left(\mathbf{C}_{6} \mathbf{F}_{5}\right)_{4}\right]$ with $\mathbf{C H}_{\mathbf{2}}=\mathbf{C H O P h}(2 g)$. An NMR tube was charged with ( $\alpha$-diimine) $\mathrm{PdMeCl}(11.1 \mathrm{mg}, 0.0198 \mathrm{mmol})$ and $\left[\mathrm{Li}\left(\mathrm{Et}_{2} \mathrm{O}\right)_{2.8}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right](18.4 \mathrm{mg}, 0.0206$ $\mathrm{mmol}) . \mathrm{CD}_{2} \mathrm{Cl}_{2}(0.4 \mathrm{~mL})$ and $\mathbf{2 g}(0.021 \mathrm{mmol})$ were added by vacuum transfer at $-196^{\circ} \mathrm{C}$. The tube was warmed to $20^{\circ} \mathrm{C}$, shaken vigorously, and monitored periodically by NMR. NMR analysis showed that after $10 \mathrm{~min}, \mathbf{6}$ and phenol had formed quantitatively.

## 7. Reaction of $\mathbf{1}\left[\mathrm{SbF}_{6}\right]$ with 2a-g.

7.1 Reaction of $1\left[\mathbf{S b F}_{6}\right]$ with $\mathbf{C H}_{\mathbf{2}}=\mathbf{C H O}^{\mathbf{t}} \mathbf{B u}$ (2a). An NMR tube was charged with $\mathbf{1}\left[\mathrm{SbF}_{6}\right](14.9 \mathrm{mg}, 0.0178 \mathrm{mmol})$ and $\mathbf{2 a}(0.0325 \mathrm{mmol}) . \mathrm{CD}_{2} \mathrm{Cl}_{2}$ was added by vacuum transfer at $-196{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR spectrum at $-60{ }^{\circ} \mathrm{C}$ confirmed the formation of $\mathbf{3 a}\left[\mathrm{SbF}_{6}\right]$. The tube was kept at $0{ }^{\circ} \mathrm{C}$ for 10 min . All the volatiles were evacuated and $\mathrm{CD}_{2} \mathrm{Cl}_{2}(0.4 \mathrm{~mL})$ was added by vacuum transfer at $-196{ }^{\circ} \mathrm{C}$. The tube was warmed to $0{ }^{\circ} \mathrm{C}$ and monitored by ${ }^{1} \mathrm{H}$ NMR periodically. Complex $\mathbf{3 a}\left[\mathrm{SbF}_{6}\right]$ was converted to $\mathbf{4 a}\left[\mathrm{SbF}_{6}\right]$ and $\mathbf{5 a}\left[\mathrm{SbF}_{6}\right]$. The NMR resonances of $\mathbf{4 a}\left[\mathrm{SbF}_{6}\right]$ and $\mathbf{5 a}\left[\mathrm{SbF}_{6}\right]$ is very similar to $\mathbf{4 a}\left[\mathbf{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$ and $\mathbf{5 a}\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$. The first-order rate constant for the consumption of $\mathbf{3 a}\left[\mathrm{SbF}_{6}\right]$ measured by the disappearance of the $\operatorname{Pd} M e{ }^{1} \mathrm{H}$ NMR resonance is $k_{\text {insert, }} \mathbf{3 c}=3.29(2) \times 10^{-5} \mathrm{~s}^{-1}$ at $0{ }^{\circ} \mathrm{C}$. After $\mathbf{3 a}\left[\mathrm{SbF}_{6}\right]$ is fully consumed, the tube was warmed to $20{ }^{\circ} \mathrm{C}$ and monitored by ${ }^{1} \mathrm{H}$ NMR periodically. NMR analysis showed a mixture of $\mathbf{4 a}\left[\mathrm{SbF}_{6}\right](66 \%), \mathbf{5 a}\left[\mathrm{SbF}_{6}\right](22 \%)$ and $\mathbf{6}\left[\mathrm{SbF}_{6}\right](12 \%)$ was present after 5 min . The first-order rate constant for the consumption of $\mathbf{3 a}\left[\mathrm{SbF}_{6}\right]$ measured by the
disappearance of the $\operatorname{Pd} M e{ }^{1} \mathrm{H}$ NMR resonance is $k_{\text {insert, } 3 \mathrm{c}}=3.29(2) \times 10^{-5} \mathrm{~s}^{-1}$ at $0^{\circ} \mathrm{C}$ and $k_{\text {insert, }}$, $3 \mathrm{c}=6.33(5) \times 10^{-4} \mathrm{~s}^{-1}$ at $20^{\circ} \mathrm{C}$. The first-order rate constant for consumption of the total of $\mathbf{4 a}\left[\mathrm{SbF}_{6}\right]$ and $\mathbf{5 a}\left[\mathrm{SbF}_{6}\right]$ measured by the disappearance of the $\mathrm{PdCH}_{2} \mathbf{C H M e}$ resonance of $\mathbf{4 a}\left[\mathrm{SbF}_{6}\right]$ and the $\mathrm{PdCMe} e_{2}$ resonance of $\mathbf{5 a}\left[\mathrm{SbF}_{6}\right]$ is $k_{\beta-\mathrm{OtBu}, \text { obs }}=1.50(2) \times 10^{-5} \mathrm{~s}^{-1}$ at $20^{\circ} \mathbf{C}$.

### 7.3 Simulation of the concentration data for the reaction of $1\left[\mathrm{SbF}_{6}\right]$ with $\mathbf{2 b}$.

The first-order rate constant for the consumption of $\mathbf{3 b}\left[\mathrm{SbF}_{6}\right]$ measured by the disappearance of the $\operatorname{Pd} M e{ }^{1} \mathrm{H}$ NMR resonance is $k_{\text {insert, } \mathbf{3 b}}=8.41(6) \times 10^{-5} \mathrm{~s}^{-1}$ at $0^{\circ} \mathrm{C}$. The first-order rate constant for consumption of the total of $\mathbf{4 b}\left[\mathrm{SbF}_{6}\right]$ and $\mathbf{5 b}\left[\mathrm{SbF}_{6}\right]$ measured by the disappearance of the $\mathrm{PdCH}_{2} \mathbf{C H M e}$ resonance of $\mathbf{4 b}\left[\mathrm{SbF}_{6}\right]$ and the $\mathrm{PdCMe}{ }_{2}$ resonance of $\mathbf{5 b}\left[\mathrm{SbF}_{6}\right]$ is $k_{\beta-\mathrm{OtBu} \text {, obs }}=2.65(3) \times 10^{-5} \mathrm{~s}^{-1}$ at $0{ }^{\circ} \mathrm{C}$. By using these two rate constants, simulation ${ }^{9}$ was performed to demonstrate the change in concentrations of $\mathbf{3} \mathbf{b}\left[\mathrm{SbF}_{6}\right], \mathbf{4 b}\left[\mathrm{SbF}_{6}\right]$, $\mathbf{5 b}\left[\mathrm{SbF}_{6}\right]$ and $\mathbf{6}\left[\mathrm{SbF}_{6}\right]$ over time. The simulated data agree very well with the experimental data. Similarly, the comparison between the simulated data and the experimental data was carried out for the $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}$ anion, which also shows good agreement.

Based on the simulation results, it is concluded that the rate constants determined from the experimental data are very reliable. The comparison of the $k_{\text {insert, } \mathbf{3 b}}$ between $\mathrm{SbF}_{6}$ anion
and $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}$ anion both at $0^{\circ} \mathrm{C}$ and at $20^{\circ} \mathrm{C}$ showed that the anion only has minimal affect on the insertion rate (Table 2, 3). The similar comparison of the $k_{\text {insert, 3a }}$ gave the same conclusion.

Figure 7.13. The experimental and simulated concentration vs time plot for $\mathrm{SbF}_{6}$ anion. Series 1-3 are the simulated concentration of $\mathbf{3 b}, \mathbf{4 b}+\mathbf{5 b}$ and $\mathbf{6}$ over time, by using $k_{\text {insert }, 3}=$ $8.41 \times 10^{-5} \mathrm{~s}^{-1}$, and $k_{\beta-\text { OR, obs }}=2.65 \times 10^{-5} \mathrm{~s}^{-1}$. Series 4-6 are the experimental concentration of 3b, $\mathbf{4 b}+\mathbf{5 b}$ and $\mathbf{6}$ over time.

7.9 Construction of the energy diagram for competitive binding of vinyl ethers and insertion of 3a-g (Figure 1 in manuscript).

The competitive binding of ethylene and $\mathrm{CH}_{2}=\mathrm{CHOR}$ (2a-c) (eq 1) was quantified by measuring $K_{2 / \text { ethylene }}=[3]\left[\mathrm{CH}_{2}=\mathrm{CH}_{2}\right]\left[(\alpha \text {-diimine }) \operatorname{PdMe}\left(\mathrm{CH}_{2}=\mathrm{CH}_{2}\right)^{+}\right]^{-1}[\mathbf{2}]^{-1}$. The $K_{2 \mathrm{a} / 2 \mathrm{c}}$ was determined according to equation i-iii. $K_{\mathbf{2 b} / \mathbf{c} \mathbf{c}}$ was determined in an analogous manners and the results are shown in Tables 2 and 3.

$$

$\Delta G$ for ( $\alpha$-diimine $) \operatorname{PdMe}\left(\mathrm{CH}_{2}=\mathrm{CHOR}\right)^{+}(\mathbf{3 a - g})$ versus 3c was determined by equation (iv).

The free energy barrier for the insertion of $\mathbf{3 a - g}\left(\Delta G^{\neq}\right)$was calculated by Erying equation
(v). The results are compared in Figure 1.

## 8. X-Ray Crystallography.

8.1 $\left[(\alpha\right.$-diimine $\left.) \operatorname{Pd}\left(\boldsymbol{\eta}^{3}-\mathrm{C}_{3} \mathbf{H}_{5}\right)\right]\left[B\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]\left(6\left[B\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]\right)$. Single crystals of $\mathbf{6}\left[B\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$ were obtained by slow diffusion of hexanes into the concentrated $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution at room temperature. The molecular structure of $\mathbf{6}\left[\mathbf{B}\left(\mathbf{C}_{\mathbf{6}} \mathbf{F}_{\mathbf{5}}\right)_{\mathbf{4}}\right]$ was determined by X-ray diffraction and is shown in Figure 8.1 and the crystallographic data are summarized in Table 8.1. Data were collected on a Bruker Smart Apex diffractometer using Mo K $\alpha$ radiation ( 0.71073 Å). Direct methods were used to locate The Pd atom as well as many C atoms from the E-map. Repeated difference Fourier maps allowed recognition of all expected non-H atoms. Following anisotropic refinement of all non-hydrogen atoms, ideal H atom positions were calculated. Final refinement was anisotropic for $\mathrm{Pd}, \mathrm{N}, \mathrm{B} \mathrm{F}$ and C and isotropic-riding for H atoms. Positional disorder was apparent for C29, C30 and C31. C30 was spit into two atoms, C30A and C30B each with occupancies of 0.5 . C30A and C30B were refined as isotropic atoms while the displacement parameters for C29 and C31 showed elongation due to the positional disorder. No other anomalous bond lengths or thermal parameters were noted. All ORTEP diagrams have been drawn with $50 \%$ probability ellipsoids.

## 9. DFT Calculations.

9.1 DFT studies of the structure of 4a and 5a. DFT studies at the B3LYP level using the 6-31G* (for C, $\mathrm{H}, \mathrm{N}, \mathrm{O}$ ) and Lanl2DZ (for Pd) basis sets provide additional evidence for the O-chelated structures in $\mathbf{4 a}$ and $\mathbf{5 a} .{ }^{10}$ The optimized structures of $\mathbf{4 a}$ and $\mathbf{5 a}$ are shown in Figure 9.1. The calculated Pd-O distances are $2.19 \AA(\mathbf{4 a})$ and $2.15 \AA(\mathbf{5 a})$, which are typical for $\mathbf{P d}(\mathrm{II})-\mathrm{OR}_{2}$ distances. ${ }^{11}$ DFT studies show that the energy difference between $\mathbf{4 a}$ and $\mathbf{5 a}$ is
small $\left(\mathrm{E}_{4 \mathrm{a}}-\mathrm{E}_{5 \mathrm{a}}=0.2 \pm 1.0 \mathrm{kcal} / \mathrm{mol}\right)$, which is consistent with the fact that both isomers are observed.
