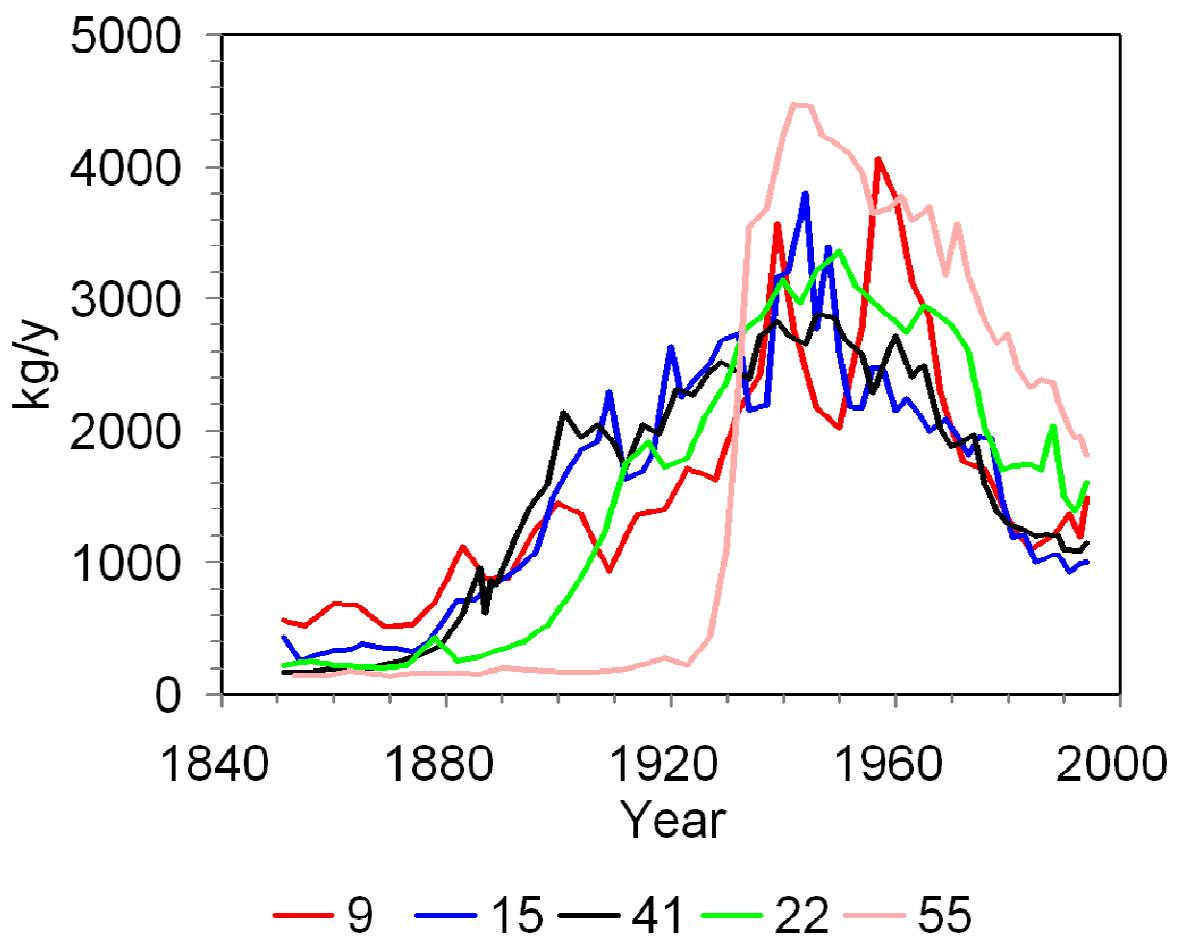

Figure S1. Cores considered for construction of a Lake Michigan mercury load function. Core 41 was selected to represent annual loads to the lake.

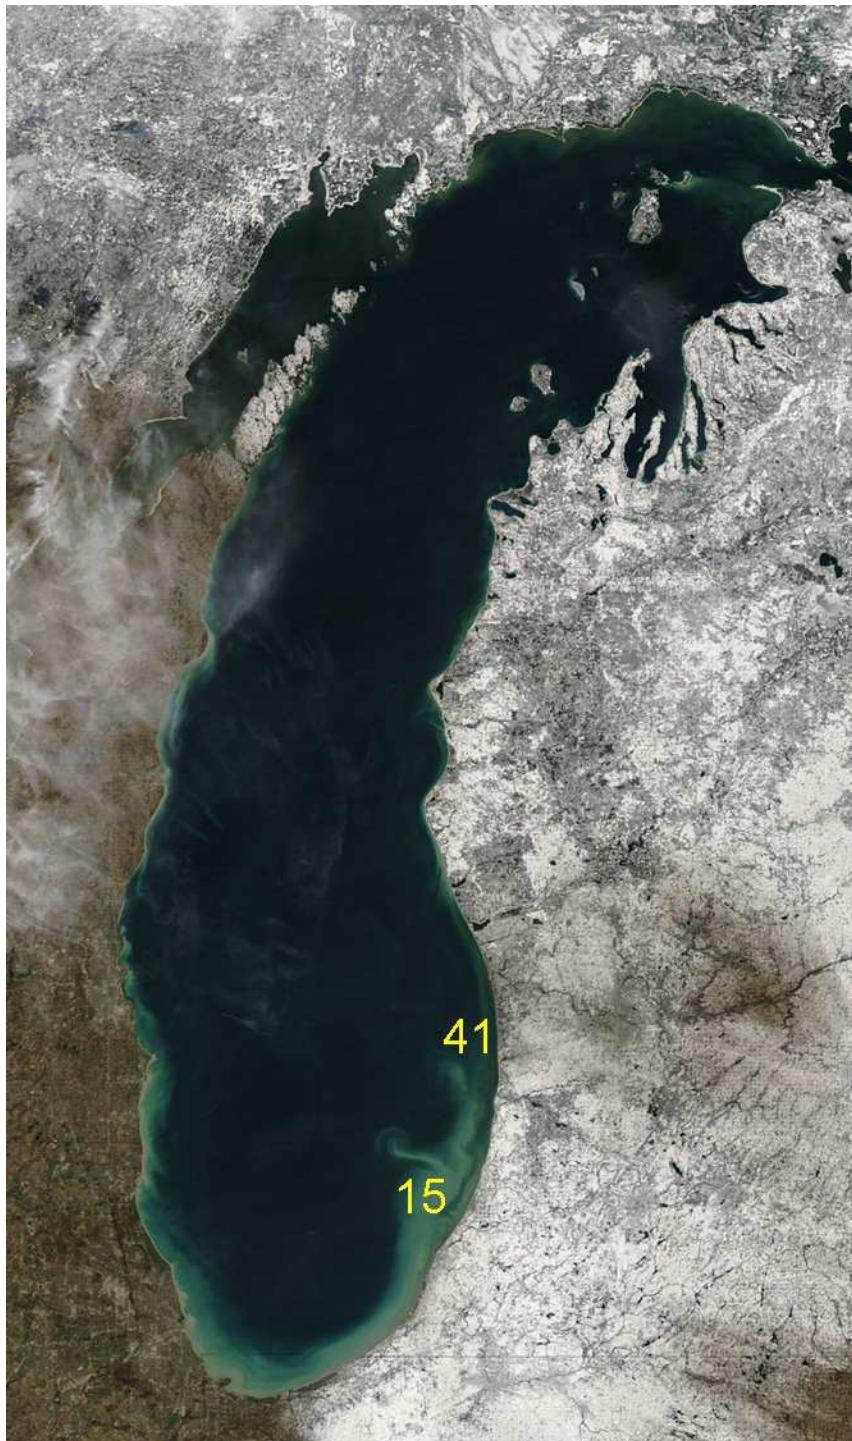

Figure S2. Locations of high resolution stations having the earliest maximum peak mercury flux relative to the recurring resuspended sediment plume in Lake Michigan as captured by NASA/GSFC MODIS Rapid Response satellite imagery.

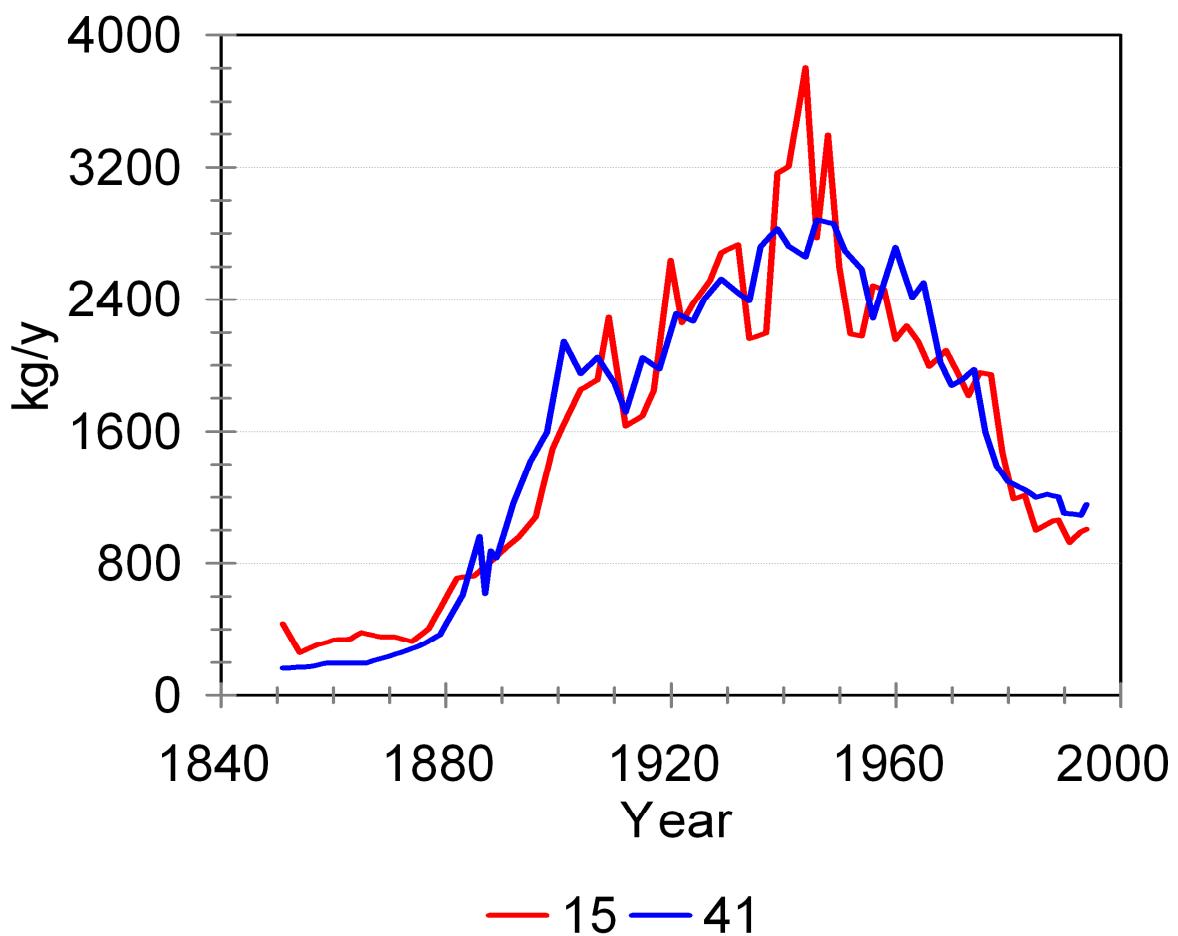

Figure S3. Comparison of the time variation of mercury loads (kg/y) to Lake Michigan for the highest quality cores collected between 1994 and 1996.

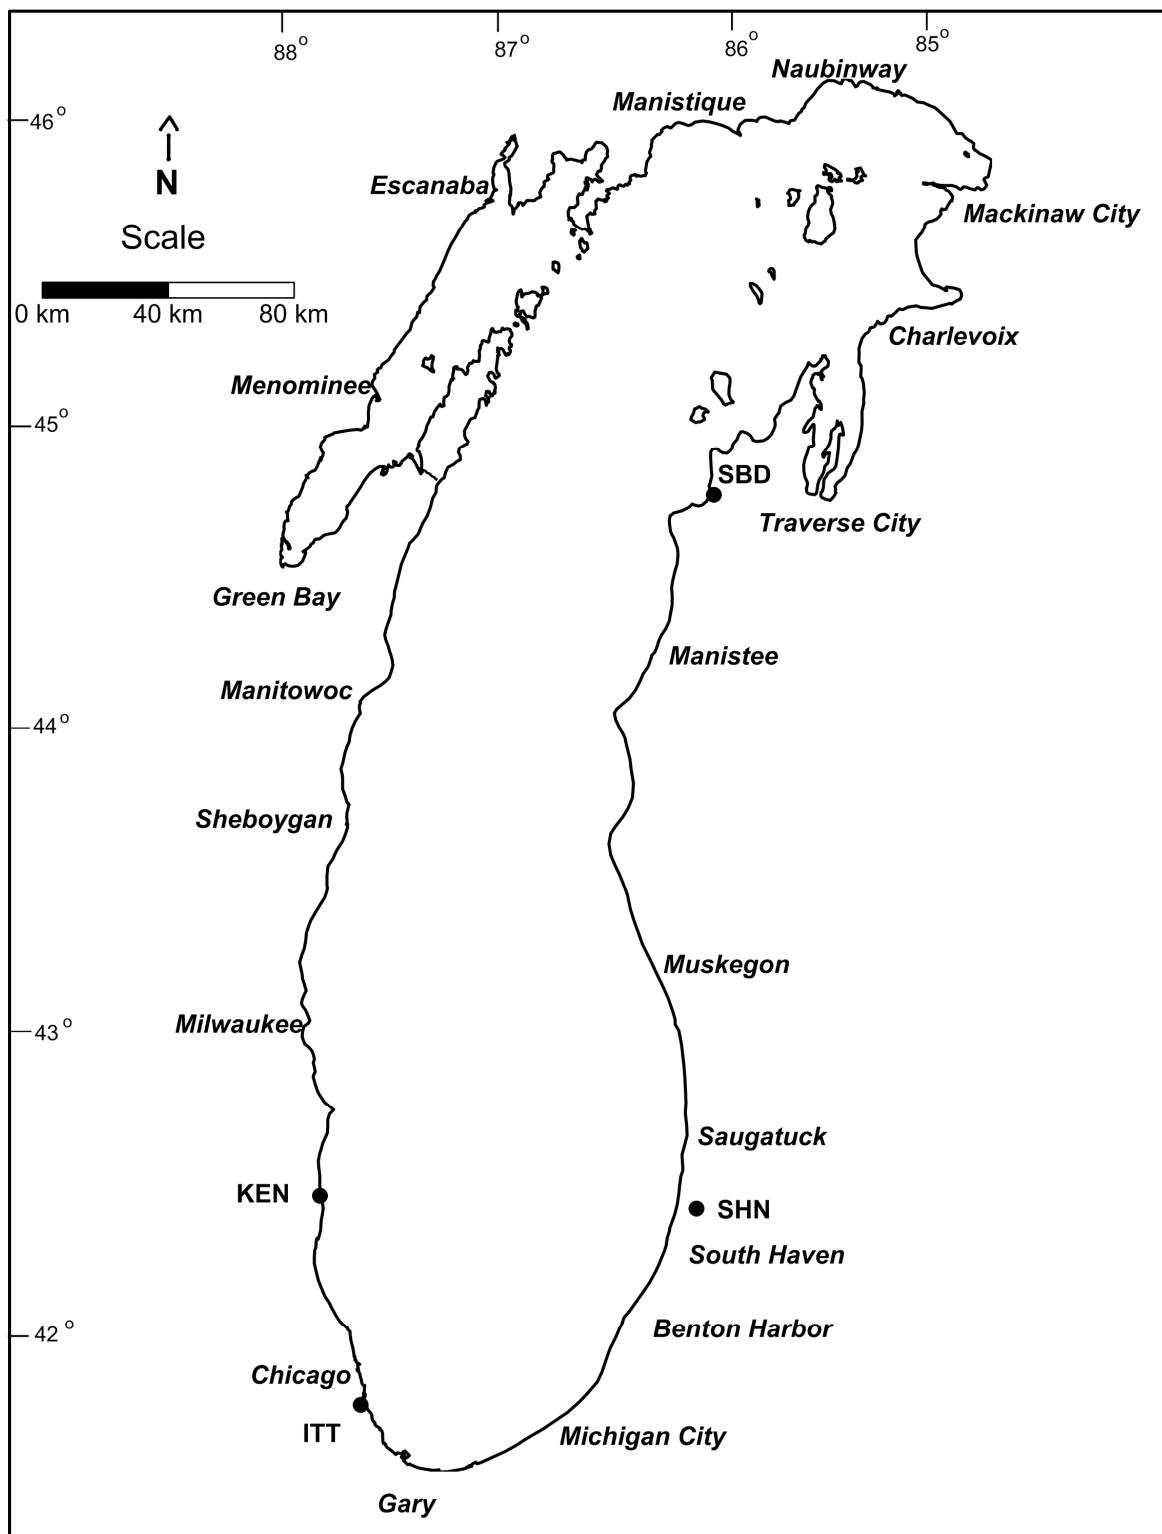

Figure S4. Locations of stations used by Landis and Keeler (43) to estimate atmospheric mercury fluxes to Lake Michigan. A station in east-central Illinois at Bondville is not shown.
