General Methods. N,N-Dimethylformamide was stored over activated molecular sieves for 72 hours, then distilled with reduced pressure over more activated molecular sieves. Methanol was dried with magnesium methoxide. Toluene was dried by reflux over calcium hydride for 10 min followed by distillation from calcium hydride. Sodium hydride was a $60 \%$ oil dispersion that was washed with dry hexane under nitrogen before use. Reactions involving sodium hydride were performed in flame-dried glassware. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded at 300 K in 5 mm NMR tubes on NMR spectrometers operating at 250.13 and 62.9 , respectively or at 500.13 and 125.08 MHz , respectively, on solutions in chloroform- $d$, unless otherwise indicated. Chemical shifts are given in parts per million $(\mathrm{ppm})(+/-0.01 \mathrm{ppm})$ relative to that of tetramethylsilane $($ TMS $)(0.00 \mathrm{ppm})$ in the case of ${ }^{1} \mathrm{H}$ NMR spectra, and to the central line of chloroform $-d(* 77.16)$ for the ${ }^{13} \mathrm{C}$ NMR spectra. All assignments were made with the aid of COSY, HETCOR, and/or long-range HETCOR experiments at 250 MHz or DGF COSY, HSQC or HMBC experiments at 500 MHz . High resolution electrospray mass spectra (HR ESI MS) were recorded on samples dissolved in methanol using trilysine KKK or rifampicin or the Tuning Mix from Agilent as references. Most TLC was performed on aluminum-backed plates bearing 200 um silica gel $60 \mathrm{~F}_{254}$. Benzylidene acetals were visualized by quenching of fluoresence or by spraying the plate with a solution ${ }^{22}$ of $0.2 \% p$-methoxyphenol in ethanol/2 $\mathrm{N}_{2} \mathrm{SO}_{4}(1 / 1, \mathrm{v} / \mathrm{v})$ or an acidic solution of anisaldehyde in ethanol [ethanol ( 9 mL ), anisaldehyde ( 0.5 mL ), and conc. sulfuric acid $(0.5 \mathrm{~mL})]^{23}$ or a solution of $2 \%$ ceric sulfate in 1 M sulfuric acid and followed, for all spray reagents, by heating on a hot plate until colour developed. TLC for quaternary ammonium salts was performed on aluminum-backed plates bearing 200 um basic alumina and developed with the Dragendorf reagent. Diethyl ( $\mathrm{N}, \mathrm{N}$-dimethylcarbamoyl)methylphosphonate was prepared as described by Bartlett et al ${ }^{16}$ for the dimethyl analog and had physical properties as described. ${ }^{24}$

General Method for Alkylation: 5,5'-Bis(octyloxymethyl)-2-phenyl-1,3-dioxane (5). A hexaneswashed sodium hydride oil dispersion ( $60 \%$ oil dispersion, $8.6 \mathrm{~g}, 0.22 \mathrm{~mol}, 2.0 \mathrm{eq}$ ) was added in
portions slowly to a stirred solution of mono- $O$-benzylidenepentaerythritol ${ }^{12}$ (4) ( $\left.24.11 \mathrm{~g}, 0.1076 \mathrm{~mol}\right)$ in dry DMF $(600 \mathrm{~mL})$ under a nitrogen atmosphere. The stirred reaction mixture was cooled with an ice water bath for one hour, then 1-bromooctane $(46.76 \mathrm{~mL}, 51.90 \mathrm{~g}, 0.268 \mathrm{~mol}, 2.5 \mathrm{eq})$ was added dropwise over 2 h . After the reaction mixture had been stirred 12 h , another addition of sodium hydride ( $4.5 \mathrm{~g}, 0.11 \mathrm{~mol}, 1.0 \mathrm{eq}$ ) and 1-bromooctane ( $20 \mathrm{~mL}, 0.11 \mathrm{~mol}, 1.0 \mathrm{eq}$ ) was made. If after the reaction mixture had been stirred a further 12 h , TLC showed that some mono- $O$-octyl product was present, another identical addition was made. When all of the mono- $O$-octyl derivative had been consumed, the reaction mixture was quenched by the addition of methanol dropwise until foaming ceased. The reaction mixture was filtered under vacuum and the solid was washed with dichloromethane ( $\sim 150 \mathrm{~mL}$ ). The combined filtrate and washings were concentrated and the residue was extracted with hexanes ( 300 mL , then 200 mL ). The combined extracts were concentrated to an oily residue that was passed through a short silica gel column using hexanes, then $5 \%$ ethyl acetate $/ 95 \%$ hexanes as eluents. Compound $\mathbf{1 3}$ (9.98 g, 17.2 mmol ), dimethylamine in THF ( $2 \mathrm{M}, 87 \mathrm{~mL}, 0.17 \mathrm{~mol}, 10 \mathrm{eq}$ ) and potassium carbonate ( $5.9 \mathrm{~g}, 43 \mathrm{mmol}, 2.5$ eq) were added to a sealed tube with the aid of THF $(10 \mathrm{~mL})$. The reaction mixture was stirred at $160 \sim 170{ }^{\circ} \mathrm{C}$. After one week, all of the starting material had been consumed and the reaction mixture was filtered and the solvent was removed in vaccuo at $35 \sim 40{ }^{\circ} \mathrm{C}$ to give a yellow oil, $N, N, N^{\prime}, N^{\prime}-$ tetramethyl-2,2-bis(octyloxymethyl)-1,3-propanediamine (1.1). The crude oil was taken up in dichloromethane ( 50 mL ) and the resulting solution was shaken with ice cold $2 \mathrm{M} \mathrm{HCl}(75 \mathrm{~mL})$. The aqueous layer was extracted with dichloromethane ( $2 \times 50 \mathrm{~mL}$ ), then the combined organic layers were washed with water $(20 \mathrm{~mL})$, dried $\left(\mathrm{MgSO}_{4}\right)$, and concentrated to give the title compound as a light

General procedure for reaction of dialkoxides with 2-(dimethylamino)ethyl chloride hydrochloride: $\quad N, N, N^{\prime}, N^{\prime}$-tetramethyl-5,5-bis(octyloxymethyl)-3,7-dioxa-1,9-nonanediaminium dichloride (4.5). Sodium hydride ( $3.36 \mathrm{~g}, 0.14 \mathrm{~mol}, 10 \mathrm{eq}$ ) was added slowly to a stirred solution of 2,2-dioctyloxymethyl-1,3-propanediol (9) (5.05 g, 0.014 mol$)$ in DMF ( 500 mL ) under nitrogen gas at rt and the mixture was stirred vigorously for 1 h . 2-(Dimethylamino)ethyl chloride hydrochloride $(8.08 \mathrm{~g}, 0.05 \mathrm{~mol}, 4 \mathrm{eq})$ was added and the reaction mixture was stirred at $50{ }^{\circ} \mathrm{C}$ under an $\mathrm{N}_{2}$ atmosphere for 12 h , then quenched with methanol. The mixture was filtered and concentrated. The residue was taken up in diethyl ether ( 50 mL ) and the resulting solution was washed with brine ( 50 $\mathrm{mL})$, dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated at $30-35{ }^{\circ} \mathrm{C}$ to give $N, N, N^{\prime}, N^{\prime}$-tetramethyl-5,5-

## General procedure for reaction of dialkoxides with 2-bromo- $\mathbf{N}, \mathbf{N}$-diethylethylamine

 hydrobromide: $N, N, N^{\prime}, N^{\prime}$-tetraethyl-5,5-bis(octyloxymethyl)-3,7-dioxa-1,9-nonanediaminium dihydrochloride (4.17). Sodium hydride ( $6.10 \mathrm{~g}, 0.15 \mathrm{~mol}, 10 \mathrm{eq}$ ) was added slowly to a stirred solution of 2,2-dioctyloxymethyl-1,3-propanediol (9) (5.50 g, 0.015 mol$)$ in THF ( 500 mL ) under $\mathrm{N}_{2}$ gas at rt . When foaming ceased, the mixture was stirred vigorously at $60^{\circ} \mathrm{C}$ for 1 h . The reaction mixture was cooled to rt, then 2-bromo- $N, N$-diethylethylamine hydrobromide ( $15.95 \mathrm{~g}, 0.061 \mathrm{~mol}, 4.0$eq) was added. The reaction mixture was stirred at $60^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ gas for 12 h , then quenched with methanol. The reaction mixture was filtered and the filtrate concentrated to a syrupy residue. The residue was taken up in diethyl ether $(50 \mathrm{~mL})$ and the resulting solution was washed with brine $(50 \mathrm{~mL})$, dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated at $30-35^{\circ} \mathrm{C}$ to give crude $N, N, N^{\prime}, N^{\prime}$-tetraethyl-5,5-bis(octyloxymethyl)-3,7-dioxa-1,9-nonanediamine (4.13). ## General procedure for reaction with 3-chloro-N,N-dimethyl-1-propanamine hydrochloride:

 $N, N, N^{\prime}, N^{\prime}$-Tetramethyl-6,6-bis(octyloxymethyl)-4,8-dioxa-1,11-undecanediamine (5.1). Sodium hydride ( $1.33 \mathrm{~g}, 55.4 \mathrm{mmol}$ ) was added slowly to a stirred solution of 2,2-dioctyloxymethyl-1,3propanediol (9) (2.0 g, 5.5 mmol$)$ in DMF $(100 \mathrm{~mL})$ under an $\mathrm{N}_{2}$ atmosphere at $50{ }^{\circ} \mathrm{C}$. The mixture was then stirred at $80^{\circ} \mathrm{C}$ for 1 h . After the reaction mixture had been allowed to cool to rt , 3-chloro$N, N$-dimethyl-1-propanamine hydrochloride $(1.93 \mathrm{~g}, 12.2 \mathrm{mmol})$ was added in portions and the reaction mixture was stirred at $80^{\circ} \mathrm{C}$ under nitrogen for another 24 h , then quenched with methanol and filtered. The filtrate was concentrated, and the residue was taken up in ethyl acetate ( 50 mL ). This solution was washed with water $(2 \times 20 \mathrm{~mL})$ and brine $(20 \mathrm{~mL})$, then dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated to a residue that was purified by flash column chromatography.
