Materials and Methods. Unless stated otherwise, reactions were performed in flame-dried glassware sealed with rubber septa under a nitrogen atmosphere and were stirred with Tefloncoated magnetic stir bars. Liquid reagents and solvents were transferred via syringe using standard Schlenk techniques. Tetrahydrofuran (THF) and diethyl ether $\left(\mathrm{Et}_{2} \mathrm{O}\right)$ were distilled over sodium/benzophenone ketyl. Dichloromethane $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$, toluene, methanol (MeOH), and benzene were distilled over calcium hydride. Potassium acetate (KOAc) was dried at $130{ }^{\circ} \mathrm{C}$ under vacuum overnight prior to use. All other solvents and reagents were used as received unless otherwise noted. Reaction temperatures above $23{ }^{\circ} \mathrm{C}$ refer to oil bath or heating block temperatures, which were controlled by an IKAmag ${ }^{\circledR}$ temperature modulator. Thin layer chromatography was performed using SiliCycle silica gel 60 F - 254 precoated plates ( 0.25 mm ) and visualized by UV irradiation and anisaldehyde stain or CAM stain. Sorbent silica gel (particle size 40-63 $\mu \mathrm{m}$ ) was used for flash chromatography. ${ }^{1} \mathrm{H}$ NMR were recorded on a Bruker AV-600 (at 600 MHz ) spectrometer, and ${ }^{13} \mathrm{C}$ NMR were recorded on a Bruker AV-600 spectrometer (at 150 MHz ). ${ }^{19} \mathrm{~F}$ NMR were recorded on a Bruker AVQ-400 spectrometer (at 376 $\mathrm{MHz}) .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ chemical shifts ( $\delta$ ) are reported relative to the residual solvent signal, $\mathrm{CHCl}_{3}$ ( $\delta=7.26$ for ${ }^{1} \mathrm{H}$ NMR and $\delta=77.16$ for ${ }^{13} \mathrm{C}$ NMR) or $\mathrm{C}_{6} \mathrm{H}_{6}\left(\delta 7.16\right.$ for ${ }^{1} \mathrm{H}$ and $\delta 128.06$ for ${ }^{13} \mathrm{C}$ ). ${ }^{19} \mathrm{~F}$ chemical shifts are reported relative to $\mathrm{CFCl}_{3}$ at 0 ppm . Data for ${ }^{1} \mathrm{H}$ NMR are reported as follows: chemical shift (multiplicity, coupling constants where applicable, number of hydrogens). Abbreviations are as follows: s (singlet), d (doublet), t (triplet), q (quartet), dd (doublet of doublet), ddd (doublet of doublet of doublet), $m$ (multiplet), br (broad). IR spectra were recorded on a Nicolet MAGNA-IR 850 spectrometer and are reported in frequency of absorption $\left(\mathrm{cm}^{-1}\right)$. High resolution mass spectral data were obtained from the University of California, Berkeley Mass Spectral Facility.

Enone 6. Diels-Alder adduct $9(4.02 \mathrm{~g}, 10.5 \mathrm{mmol})$ in benzene ( $10.5 \mathrm{~mL}, 1.0 \mathrm{M}$ ) was injected into a quartz tube ( $\sim 2 \mathrm{~cm}$ in diameter) inside a tube furnace ( 12 in ) at $600{ }^{\circ} \mathrm{C}$ under vacuum ( $\sim 0.02$ torr) (see Figure S 1 ). Tertiary allylic alcohol 10. Lithium diisopropyl amide was generated by the addition of n-BuLi (10.7 mL of a 2.5 M soln. in hexanes, $27 \mathrm{mmol}, 2.3$ equiv) to a solution of diisopropyl amine ( $3.9 \mathrm{~mL}, 28 \mathrm{mmol}, 2.4$ equiv) in 50 mL of THF at $-78^{\circ} \mathrm{C}$. The solution of LDA was stirred for 1 h at this temperature. Picoline $5^{3}\left(2.34 \mathrm{~g}, 11.6 \mathrm{mmol}, 1\right.$ equiv) in THF ( 30 mL ) at $-78{ }^{\circ} \mathrm{C}$ was then added to the LDA solution via cannula. The resulting apple-red solution was stirred 30 min at $-78{ }^{\circ} \mathrm{C}$. At this time, enone $\mathbf{6}\left(3.87 \mathrm{~g}, 12.1 \mathrm{mmol}, 1.04\right.$ equiv) in THF $(30 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ was transferred to the reaction flask via cannula, and the color of the solution turned to orange. After stirring for 25 min , the reaction mixture was quenched at $-78{ }^{\circ} \mathrm{C}$ with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ $(50 \mathrm{~mL})$ and then allowed to come to rt . The mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 200 \mathrm{~mL})$, and the organic layers were combined, washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$, filtered, and concentrated under reduced pressure. The majority of impurities in the crude product could be removed by flash chromatography ( $29: 1$ hexanes/EtOAc). The mixture was stirred at $65^{\circ} \mathrm{C}$ for 18.5 h and then diluted with EtOAc ( 8 mL ) and saturated aqueous $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$. The layers were separated and the aqueous layer was extracted with additional EtOAc ( 2 x 8 mL ). The combined organic layers were then washed sequentially with saturated aqueous $\mathrm{NaHCO}_{3}(2 \times 5 \mathrm{~mL}), \mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$, and brine ( 5 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under reduced pressure. The crude product was purified by flash chromatography (eluting with a gradient of $4: 1$ to $2: 1$ hexanes/EtOAc) to give 5.3 mg ( $60 \%$ yield over three steps) of $\mathrm{N}-\mathrm{Cbz}-\mathrm{G} . \mathrm{B} .13$ (17) as a colorless oil. $\mathbf{R}_{\mathbf{f}} 0.45$ (1:2 hexanes/EtOAc); ${ }^{\mathbf{1}} \mathbf{H} \mathbf{N M R}\left(600 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}\right) \delta 7.32-7.28(\mathrm{~m}, 2 \mathrm{H})$, 7.17-7.13 (m, 2H), 7.09-7.05 (m, 1H), $5.96(\mathrm{~d}, J=2.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.21(\mathrm{~s}, 2 \mathrm{H}), 4.71-4.62(\mathrm{~m}, 1 \mathrm{H})$, 4.45-4.35 (m, 1H), 2.64-2.50 (m, 2H), 1.95-1.88 (m, 1H), 1.72-1.62 (m, 4H), 1.53-1.42 (m, 3H), $1.34-1.22(\mathrm{~m}, 3 \mathrm{H}), 1.18-1.12(\mathrm{~m}, 1 \mathrm{H}), 1.12-0.84(\mathrm{~m}, 9 \mathrm{H}), 0.84-0.79(\mathrm{~m}, 1 \mathrm{H}), 0.63-0.54(\mathrm{~m}, 1 \mathrm{H})$; ${ }^{13} \mathbf{C}$ NMR (150 MHz, $\left.\mathrm{C}_{6} \mathrm{D}_{6}\right) \delta 198.7,172.2,155.5,137.8,119.0,80.8,67.2,56.4,52.3,47.10$, $47.05,45.9,45.0,35.8,35.5,31.4,30.0,29.9,26.6,26.2,25.6,20.0,19.0$; IR (film) 3423,2931 , 2852, 1687, 1665, 1414, $1317 \mathrm{~cm}^{-1}$; HRMS (ESI ${ }^{+}$) calc'd for $\left[\mathrm{C}_{28} \mathrm{H}_{36} \mathrm{O}_{4} \mathrm{~N}\right]^{+}(\mathrm{M}+\mathrm{H})^{+}: \mathrm{m} / \mathrm{z}$ 450.2639 , found 450.2640 .

G. B. 13 (2). The procedure of Movassaghi, et al., ${ }^{5}$ was followed. Trimethylsilyliodide (1 drop every 25 min for $125 \mathrm{~min}, \sim 0.06 \mathrm{~mL}$ total) was added to a solution of $17(5.3 \mathrm{mg}, 0.012 \mathrm{mmol})$

[^3]in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. After 125 min , TLC analysis indicated the complete consumption of starting material, and 1.5 mL 1 N HCl was added at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was allowed to stir with warming to rt and then was further diluted with $1 \mathrm{~N} \mathrm{HCl}(3.5 \mathrm{~mL})$ and hexanes $(10 \mathrm{~mL})$. The layers were separated and the organic phase was extracted with additional $1 \mathrm{~N} \mathrm{HCl}(2 \times 5$ $\mathrm{mL})$. The combined aqueous layers were washed sequentially with hexanes ( $2 \times 10 \mathrm{~mL}$ ), $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( 5 mL ), and hexanes ( 10 mL ) and then brought to pH 13 with $15 \%$ aqueous $\mathrm{NaOH}(4.5 \mathrm{~mL})$. The basic, aqueous solution was stirred at rt for 1.25 h and then extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \times 15$ mL ). The combined $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ layers were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under reduced pressure to give 2.9 mg ( $79 \%$ yield) of a $\sim 1: 2$ mixture of G. B. 13 (2) and its N conjugate addition product, 16 -oxo-himgaline, in $\mathrm{C}_{6} \mathrm{D}_{6}$. Stirring this mixture in $15 \%$ aqueous NaOH for an additional two hours followed by extraction into $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ then provided a $\sim 5: 2$ mixture of G. B. 13 and 16-oxo-himgaline (in $\mathrm{C}_{6} \mathrm{D}_{6}$ ), consistent with the observations of Evans. ${ }^{6}$ Impurities from solvents could be removed by flash chromatography (eluting with a gradient of $0.1 \% \mathrm{Et}_{3} \mathrm{~N}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to $1 \% \mathrm{Et}_{3} \mathrm{~N}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathbf{H} \mathbf{N M R}\left(600 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}\right)$ G.
