General and Materials. All NMR spectra were measured with Bruker AVANCE 400 (9.4 T magnet) spectrometer. In ${ }^{1} \mathrm{H}$ NMR spectra, chemical shifts ( ppm ) referenced to internal tetramethylsilane ( 0.00 ppm , in $\mathrm{CDCl}_{3}$ ). In ${ }^{13} \mathrm{C}$ NMR spectra, chemical shifts ( ppm ) referenced to the carbon signal of the deuterated solvents ( 77.0 ppm in $\mathrm{CDCl}_{3}, 29.3 \mathrm{ppm}$ in acetone- $d_{6}, 66.5 \mathrm{ppm}$ in 1,4-dioxane- $d_{8}$ ). IR spectra and melting points were measured with JASCO FT/IR-4100 and Büchi Melting Point B-545, respectively. Elemental and high resolution mass (HRMS) analyses were performed by Service Centre of Elementary Analysis of Organic Compounds and Institute for Materials Chemistry and Engineering (IMCE) in Kyushu University, respectively. All reactions were conducted under nitrogen atmosphere. Flash column chromatographies were performed with silica gel 60 (230-400 mesh, Merck).

Diethyl ether $\left(\mathrm{Et}_{2} \mathrm{O}\right)$ was dried with sodium-benzophenone ketyl. Dichloromethane $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ was dried with phosphorus(V) oxide. Pyridine was dried with calcium hydride. These dry solvents were distilled under nitrogen atmosphere before use. Tetrahydrofuran (THF) (HPLC grade, without inhibitor) was deoxidized by purging with nitrogen for 30 min and was dried with an alumina and copper column system (GlassContour Co.). Methyl [2-\{(trimethylsilyl)methyl\}phenyl]methyl carbonate (1a), ${ }^{1}$ 2-methyl-6-phenylbenzoic acid, ${ }^{2}$ methyl [3-phenyl-2-\{(trimethylsilyl)methyl $\}$ phenyl]methyl carbonate (1c), ${ }^{1}$ (2,6-dimethylphenyl)methanol, ${ }^{3} \quad[2,4$-dimethyl-6-\{(trimethylsilyl)methyl $\}$ phenyl $]$ methyl carbonate (1f), ${ }^{1}$ $N$-phenylmethylidene-4-methylbenzenesulfonamide (2a), ${ }^{4}$ and $\operatorname{Pd}\left(\eta^{3}-\mathrm{C}_{3} \mathrm{H}_{5}\right) \mathrm{Cp},{ }^{5,6}$ were prepared according to literature procedures.

Potassium fluoride (spray dried), 1,5-bis(diphenylphosphino)pentane (DPPPent), dry $N, N$-dimethylformamide $\left(\mathrm{H}_{2} \mathrm{O}<50 \mathrm{ppm}\right)$, lithium aluminum hydride, butyllithium solution in hexane, chlorotrimethylsilane, methyl chloroformate, 4-dimethylaminopyridine, 2,3-dimethylbenzoic acid, p-toluenesulfonamide, 2-methylbenzaldehyde, 2,6-dimethylbenzaldehyde, 4-methoxybenzaldehyde, 4-(trifluoromethyl)benzaldehyde, 3-(trifluoromethyl)benzaldehyde, 1-naphthaldehyde, 2-naphthaldehyde, (2-methyl-3-phenylphenyl)methanol, sodium bromate, sodium hydrogensulfate, acetonitrile, and lithium aluminium deuteride were purchased and used without further purification.

## Preparations of 2-[(Trimethylsilyl)methyl]benzyl Carbonates 1.

## Methyl [6-Phenyl-2-\{(trimethylsilyl)methyl\}phenyl]methyl Carbonate (1b).

A mixture ( 1.33 g ) of 2-methyl-6-phenylbenzoic acid ( 5.9 mmol estimated by ${ }^{1} \mathrm{H}$ NMR) and 2-methylbenzoic acid ( 0.70 mmol estimated by ${ }^{1} \mathrm{H}$ NMR), which was prepared according to the procedure of J. Q. Yu et al., ${ }^{2}$ was dissolved in dry THF ( 10 mL ). The solution was added dropwise to a mixture of lithium aluminum hydride ( $254 \mathrm{mg}, 6.7 \mathrm{mmol}$ ) in dry THF $(15 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ for 45 min . After hydrogen evolution ceased, the reaction mixture was stirred under reflux for 20 h . After the reaction vessel was cooled with ice bath, $\mathrm{H}_{2} \mathrm{O}$ was carefully added to the resulting mixture at $0^{\circ} \mathrm{C}$. The mixture was filtered
through a Celite pad. The filter cake was washed with methanol. The combined filtrate was extracted three times with EtOAc. The combined organic layer was washed with saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$ aq., with brine, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and then evaporated under reduced pressure. The ${ }^{1} \mathrm{H}$ NMR spectrum of the residue indicated that it contains (2-methylphenyl)methanol ( $89.4 \mathrm{mg}, 0.73 \mathrm{mmol}$ ) as well as (2-methyl-6-phenylphenyl)methanol ( $580 \mathrm{mg}, 2.9 \mathrm{mmol}, 49 \%$ ). We used the mixture for the next reaction without further purification. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{TMS}\right) \delta 2.54(\mathrm{~s}, 3 \mathrm{H}), 4.60(\mathrm{~d}, J=2.8 \mathrm{~Hz}, 2 \mathrm{H})$, 7.16-7.43 (m, 8H).

The above mixture ( 670 mg ) containing (2-methyl-6-phenylphenyl)methanol ( 2.9 mmol ) was dissolved in dry $\mathrm{Et}_{2} \mathrm{O}(7.3 \mathrm{~mL})$. A solution of butyllithium in hexane ( $1.7 \mathrm{M}, 5.1 \mathrm{~mL}, 8.5 \mathrm{mmol}$ ) was added dropwise to the solution of (2-methyl-6-phenylphenyl)methanol at $0^{\circ} \mathrm{C}$ for 30 min . After stirred under reflux for 24 h , the reaction mixture was cooled to $-78{ }^{\circ} \mathrm{C}$. Chlorotrimethylsilane ( $1.2 \mathrm{~mL}, d^{2} 0.856 \mathrm{~g} / \mathrm{mL}, 9.5 \mathrm{mmol}$ ) was added dropwise to the resulting solution for 45 min . The mixture was stirred at room temperature for 3 h , and then $10 \% \mathrm{H}_{2} \mathrm{SO}_{4}$ aq. $(4.0 \mathrm{~mL})$ was carefully added to it. After stirred at room temperature for 14 h , the mixture was extracted three times with EtOAc. The combined organic layer was washed with brine, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and then evaporated under reduced pressure. The residue was purified with a flash column chromatography ( $\mathrm{EtOAc} /$ hexane $=1 / 30$ ) to give [2-phenyl-6- $\{($ trimethylsilyl $)$ methyl $\}$ phenyl]methanol ( 574 $\mathrm{mg}, 73 \%$ ) as colorless oil: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{TMS}$ ) $\delta 0.05(\mathrm{~s}, 9 \mathrm{H}), 2.38(\mathrm{~s}, 2 \mathrm{H}), 4.51(\mathrm{~s}, 2 \mathrm{H}), 7.01$ $(\mathrm{d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.05(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.21(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.32-7.45(\mathrm{~m}, 5 \mathrm{H}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta-1.4,23.5,59.9,126.4,126.9,127.4,128.0,128.7,129.2,134.1,140.7,141.8,143.4$; IR (neat) $3566 \mathrm{w}, 3330 \mathrm{brm}, 3058 \mathrm{~m}, 3023 \mathrm{w}, 2953 \mathrm{~m}, 2897 \mathrm{~m}, 1582 \mathrm{~m}, 1494 \mathrm{w}, 1459 \mathrm{~m}, 1418 \mathrm{~m}, 1249 \mathrm{~s}$, 1192 m, 1156 m, $1069 \mathrm{w}, 1001 \mathrm{~m}, 909 \mathrm{~m}, 846 \mathrm{~s}, 802 \mathrm{~m}, 762 \mathrm{~s}, 734 \mathrm{~s}, 702 \mathrm{~s} \mathrm{~cm}^{-1}$; Anal. General Procedure. ${ }^{4}$ p-Toluenesulfonamide ( $856 \mathrm{mg}, 5.0 \mathrm{mmol}$ ) was placed in a 50 mL two-neck round-bottom flask equipped with a magnetic stirring bar, Teflon stopper, and Dean-Stark trap. A Dimroth condenser equipped with a three-way cock was placed on the Dean-Stark trap. After the reaction vessel was evacuated and charged with nitrogen, toluene ( 14 mL ) and then an aldehyde ( 6.0 mmol ) was added to the sulfonamide. The reaction mixture was refluxed for 2-4 days with azeotropic removal of water. The resulting mixture was filtered, and then evaporated under reduced pressure. The residue was recrystallized from EtOAc-hexane to give the desired $N$-tosylimines 2.

Palladium-Catalyzed [4+2] Cycloaddition of 2-[(Trimethylsilyl)methyl]benzyl Carbonates 1 with $N$-Tosylbenzimines 2

## Optimization of Reaction Conditions for the [4+2] Cycloaddition of 1a with 2a

The reactions for the optimization were conducted as follows: In a nitrogen-filled drybox, a palladium source ( $4.5 \mu \mathrm{~mol}$ ), a ligand ( 5.0 or $9.9 \mu \mathrm{~mol}$ ), $\mathbf{2 a}(46.7 \mathrm{mg}, 0.18 \mathrm{mmol})$, a fluoride source ( 0.23 mmol ), and naphthalene ( 15 mg , as an internal standard for GC analysis) were placed in a 5 mL screw-capped vial equipped with a stirring bar. After dry solvent ( 1.0 mL ) was added, the vial was sealed with a screw cap containing a PTFE/silicone septum and removed from the drybox. Substrate $\mathbf{1 a}(37.9 \mathrm{mg}, 0.15 \mathrm{mmol})$ was added into the vial through the septum by using a micro-syringe at room temperature. When TBAF $(1.0 \mathrm{M}$ solution in THF, $0.23 \mathrm{~mL}, 0.23 \mathrm{mmol}$ ) was used as a fluoride source, the solution was added into the mixture in a similar manner. The solution was stirred at 120 or $100{ }^{\circ} \mathrm{C}$. The reaction was monitored by GC
analysis with J\&W capillary column DB-1 $\left(0.53 \mathrm{~mm} \phi \times 15 \mathrm{~m}, \mathrm{~d}_{\mathrm{f}} 1.5 \mu \mathrm{~m}\right)$. The selected results of the above reactions were summarized in Table S-1.

${ }^{a}$ Reactions were conducted on a 0.15 mmol scale in DMF ( 1.0 mL ). The ratio of $\mathbf{1 a}: 2 \mathrm{a}:[\mathrm{F}]: \operatorname{Pd}\left(\eta^{3}-\mathrm{C}_{3} \mathrm{H}_{5}\right) \mathrm{Cp}:$ ligand was 100:120:150:3.0:3.3 or 6.6 . ${ }^{b}$ Amounts of ligand in mol\% to $\mathbf{1 a}$ were given in parentheses. ${ }^{c}$ Yields were determined by GC analysis (average of two runs). GC yields at 48 h were given in parentheses. ${ }^{d} 1.0 \mathrm{M}$ solution in THF was used. ${ }^{e}$ The reaction was conducted in the absence of $\operatorname{Pd}\left(\eta^{3}-\mathrm{C}_{3} \mathrm{H}_{5}\right) \mathrm{C}$. . ${ }^{f} o$-Xylylene dimer $\mathbf{1 0}$ and [2,2]orthocyclophane $\mathbf{1 1}$ were formed in $44 \%$ and $32 \%$ yield, respectively.

As seen in entry 12 of Table $\mathrm{S}-1$, compound $\mathbf{1 a}$ failed to react with $\mathbf{2 a}$ in the absence of the palladium catalyst. The substrate would be converted with KF into free $o$-xylylene. The resulting $o$-xylylene rapidly dimerized before reacting with 2a, giving the undesirable products $\mathbf{1 0}$ and $\mathbf{1 1}$ in $44 \%$ and $32 \%$ yields, respectively. The observation indicates that the formation of the cycloaddition product $\mathbf{3 a}$ requires the palladium catalysis. No side products $\mathbf{1 0}$ and $\mathbf{1 1}$ were detected in GC analyses to monitor the reactions in entries $1-9$ of Table $S-1$, Scheme 1, and Table 1. Furthermore, treatment of $\mathbf{1 a}$ with the palladium catalyst in the absence of 2a and KF yielded poly(o-xylylene) 12 and a small amount of 11, which would be formed
through Hiyama coupling. Therefore, we believe that the present palladium-catalyzed reaction does not involve free $o$-xylylene.

General Procedure A. In a nitrogen-filled drybox, $\operatorname{Pd}\left(\eta^{3}-\mathrm{C}_{3} \mathrm{H}_{5}\right) \mathrm{Cp}(1.0 \mathrm{mg}, 4.7 \mu \mathrm{~mol})$, DPPPent $(4.4 \mathrm{mg}$, $10.0 \mu \mathrm{~mol})$, and an imine $2(0.18 \mathrm{mmol})$ were placed in a 5 mL screw-capped vial equipped with a stirring bar. After dry DMF ( 1.0 mL ) was added, the vial was sealed with a screw cap containing a PTFE/silicone septum and removed from the drybox. A 2-[(trimethylsilyl)methyl $]$ benzyl carbonate $\mathbf{1}(0.15 \mathrm{mmol})$ was added into the vial through the septum by using a micro-syringe at room temperature. The solution was stirred at $120^{\circ} \mathrm{C}$ until 1 was consumed completely (monitored by GC), and then evaporated under reduced pressure. The residue was purified with a flash column chromatography ( $\mathrm{EtOAc} /$ hexane) to give the desired cycloadduct 3. Alternatively, it was purified with MPLC (EtOAc/hexane) after passed through a short silica gel column.

General Procedure B. In a nitrogen-filled drybox, $\operatorname{Pd}\left(\eta^{3}-\mathrm{C}_{3} \mathrm{H}_{5}\right) \mathrm{Cp}(1.0 \mathrm{mg}, 4.7 \mu \mathrm{~mol})$, DPPPent $(4.4 \mathrm{mg}$, $10.0 \mu \mathrm{~mol})$, an imine $2(0.18 \mathrm{mmol})$, and spray dried potassium fluoride ( $13.1 \mathrm{mg}, 0.23 \mathrm{mmol}$ ) were placed in a 5 mL screw-capped vial equipped with a stirring bar. After dry DMF $(1.0 \mathrm{~mL})$ was added, the vial was sealed with a screw cap containing a PTFE/silicone septum and removed from the drybox. A $2-[($ trimethylsilyl $)$ methyl $]$ benzyl carbonate $1(0.15 \mathrm{mmol})$ was added into the vial through the septum by using a micro-syringe at room temperature. The solution was stirred at $100{ }^{\circ} \mathrm{C}$ until $\mathbf{1}$ was consumed completely (monitored by GC), and then evaporated under reduced pressure. The residue was purified with a flash column chromatography (EtOAc/hexane) to give the desired cycloadduct 3. Alternatively, it was purified with MPLC (EtOAc/hexane) after passed through a short silica gel column.

The general procedure $B$ was followed with use of $\mathbf{1 c}(51.3 \mathrm{mg}, 0.16 \mathrm{mmol})$ and $\mathbf{2 a}(46.7 \mathrm{mg}, 0.18 \mathrm{mmol})$ (Table 2, entry 3). The reaction was conducted for 4 h . The crude product contained the cycloadducts $\mathbf{4 c}$ and $\mathbf{5 c}$ in the ratio 10:90, which was determined with the ${ }^{1} \mathrm{H}$ NMR spectrum (see Figure S-34). The crude product was purified with a flash column chromatography ( $\mathrm{EtOAc} /$ hexane $=1 / 10$ ) to give a mixture of $\mathbf{4 c}$ and $\mathbf{5 c}(51.9 \mathrm{mg}, \mathbf{4 c}: 5 \mathbf{c}=12: 88,76 \%)$ as a colorless solid. Compounds $\mathbf{4 c}$ and $\mathbf{5 c}$ are identical with $\mathbf{5 b}$ and 4b, respectively.

Alternatively, the cycloadducts were obtained from the reaction of $\mathbf{1 c}(39.1 \mathrm{mg}, 0.12 \mathrm{mmol})$ and $\mathbf{2 a}(46.7$ $\mathrm{mg}, 0.18 \mathrm{mmol}$ ) with the general procedure A (Table 2, entry 4). The reaction was conducted for 24 h . The crude product contains the cycloadducts $\mathbf{4 c}$ and $\mathbf{5 c}$ in the ratio $11: 89$, which was determined with the ${ }^{1} \mathrm{H}$ NMR spectrum (see Figure S-35). The reaction afforded a mixture of $\mathbf{4 c}$ and $\mathbf{5 c}(37.6 \mathrm{mg}, \mathbf{4 c}: 5 \mathbf{c}=10: 90)$ in 72\% yield.

The major product $5 \mathbf{c}$ can be separated from $\mathbf{4 c}$ by recrystallization. The crude product, which resulted from the reaction using $\mathbf{1 c}(49.4 \mathrm{mg}, 0.15 \mathrm{mmol})$ and $\mathbf{2 a}(47.0 \mathrm{mg}, 0.18 \mathrm{mmol})$ for 24 h with the general procedure A, was recrystallized from EtOAc-hexane after passed through a short silica gel column $($ EtOAc $/$ hexane $=1 / 3)$ to give $\mathbf{5 c}(44.2 \mathrm{mg}, 67 \%)$ as colorless crystals: $\mathrm{mp} 143.6-143.7{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{TMS}\right) \delta 2.35(\mathrm{~s}, 3 \mathrm{H}), 3.07(\mathrm{dd}, J=4.4,16.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.19(\mathrm{dd}, J=6.46,16.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.15(\mathrm{~d}$, $J=16.6 \mathrm{~Hz}, 1 \mathrm{H}), 4.60(\mathrm{~d}, J=16.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.28(\mathrm{dd}, J=4.4,6.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.02(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.07(\mathrm{~d}$, $J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.09(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.15-7.27(\mathrm{~m}, 8 \mathrm{H}), 7.34-7.44(\mathrm{~m}, 5 \mathrm{H}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}(100 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 21.4,33.9,42.9,55.3,126.9,127.1,127.37,127.45,127.9,128.39,128.45,129.0,129.3,130.9$, 133.7, 136.9, 139.7, 139.9, 140.8, 142.9; IR (thin film) $3059 \mathrm{w}, 3029 \mathrm{w}, 2919 \mathrm{w}, 2851 \mathrm{w}, 1597 \mathrm{w}, 1494 \mathrm{~m}$, $1453 \mathrm{~m}, 1335 \mathrm{~s}, 1267 \mathrm{w}, 1216 \mathrm{w}, 1158 \mathrm{~s}, 1117 \mathrm{~m}, 1090 \mathrm{~m}, 1049 \mathrm{~m}, ~ 936 \mathrm{w}, 813 \mathrm{~m}, 796 \mathrm{~m}, 761 \mathrm{~m}, 737 \mathrm{~m}$, $702 \mathrm{~s}, 665 \mathrm{~m}, 610 \mathrm{w}, 549 \mathrm{~m}, 490 \mathrm{~m}, 475 \mathrm{~s}, 432 \mathrm{~s}, 409 \mathrm{~m} \mathrm{~cm}^{-1}$; Anal. The major product was assigned to $\mathbf{5 c}$ through the reaction of methyl 1,1-dideuterio-1-[3-phenyl-2-\{(trimethylsilyl)methyl\}phenyl]methyl carbonate (1c- $\boldsymbol{d}_{\mathbf{2}}$ ) with $\mathbf{2 a}$. The labelled substrate $\mathbf{1 c}-\boldsymbol{d}_{\mathbf{2}}$ was prepared as follows.

A suspension of (2-methyl-3-phenylphenyl)methanol ( $3.97 \mathrm{~g}, 20 \mathrm{mmol}$ ), sodium bromate $(9.05 \mathrm{~g}, 60$ mmol ), and sodium hydrogensulfate monohydrate ( $2.79 \mathrm{~g}, 20 \mathrm{mmol}$ ) in acetonitrile ( 100 mL ) was stirred under reflux for 1.5 h . After cooled to room temperature, the mixture was filtered through a Celite pad. After the filtrate was evaporated under reduced pressure, the residue was dissolved in 0.5 N NaOH aq. ( 100 mL ), washed three times with EtOAc, acidified with $2 N \mathrm{HCl}$, and then extracted three times with EtOAc. The combined organic layer was washed with brine, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and then evaporated under reduced pressure to give crude 2-methyl-3-phenylbenzoic acid ( 3.28 g ). ${ }^{10}$

A solution of the crude carboxylic acid ( 3.28 g ) in THF ( 36 mL ) was added dropwise to a mixture of lithium aluminum deuteride ( $681 \mathrm{mg}, 16 \mathrm{mmol}$ ) in THF $(24 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ for 30 min . After hydrogen evolution ceased, the reaction mixture was stirred under reflux for 11 h . After the reaction vessel was cooled with ice bath, $\mathrm{H}_{2} \mathrm{O}$ was carefully added to the resulting mixture at $0^{\circ} \mathrm{C}$. The mixture was filtered through a Celite pad. The filter cake was washed with methanol. The combined filtrate was extracted three times with EtOAc. The combined organic layer was washed with saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$ aq., with brine, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and then evaporated under reduced pressure. The residue was purified with a flash column chromatography $(\mathrm{EtOAc} /$ hexane $=1 / 3)$ to give 1,1-dideuterio-1-(2-methyl-3-phenylphenyl)methanol $(1.79 \mathrm{~g}, 45 \%)$ as a colorless solid: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{TMS}$ ) $\delta 2.22(\mathrm{~s}, 3 \mathrm{H}), 1.82-2.52(\mathrm{br}, 1 \mathrm{H})$, 7.10-7.48 (m, 8H).

A solution of butyllithium in hexane $(1.6 \mathrm{M}, 7.0 \mathrm{~mL}, 11 \mathrm{mmol})$ was added dropwise to a solution of the benzylic alcohol $(1.01 \mathrm{~g}, 5.0 \mathrm{mmol})$ in dry $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ for 30 min . After stirred under reflux for 24 h , the reaction mixture was cooled to $-78^{\circ} \mathrm{C}$. Chlorotrimethylsilane ( $1.6 \mathrm{~mL}, d 0.856 \mathrm{~g} / \mathrm{mL}, 13 \mathrm{mmol}$ ) was added dropwise to the resulting solution for 30 min . The mixture was stirred at room temperature for 3 h , and then $10 \% \mathrm{H}_{2} \mathrm{SO}_{4}$ aq. ( 5.0 mL ) was carefully added to it. After stirred at room temperature for 12 h , the mixture was extracted three times with EtOAc. The combined organic layer was washed with brine, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and then evaporated under reduced pressure. The residue was purified with a flash column chromatography (EtOAc/hexane $=$ 1/5) to give 1,1-dideuterio-1-[3-phenyl-2-\{(trimethylsilyl)methyl $\}$ phenyl]methanol ( $948 \mathrm{mg}, 69 \%$ ) as a colorless solid: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{TMS}$ ) $\delta-0.29(\mathrm{~s}, 9 \mathrm{H}), 1.94(\mathrm{~s}, 1 \mathrm{H}), 2.37(\mathrm{~s}, 2 \mathrm{H}), 7.09-7.15(\mathrm{~m}, 2 \mathrm{H}), 7.26-7.40$ ( $\mathrm{m}, 6 \mathrm{H}$ ).

The silylated compound ( $665 \mathrm{mg}, 2.4 \mathrm{mmol}$ ) and 4-dimethylaminopyridine ( $4.6 \mathrm{mg}, 38 \mu \mathrm{~mol}$ ) was dissolved in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.5 \mathrm{~mL})$. After dry pyridine ( $0.32 \mathrm{~mL}, d 0.978 \mathrm{~g} / \mathrm{mL}, 4.0 \mathrm{mmol}$ ) was added,
methyl chloroformate ( $335 \mathrm{mg}, 3.5 \mathrm{mmol}$ ) was added dropwise to the solution at $0{ }^{\circ} \mathrm{C}$ for 15 min . The mixture was stirred at room temperature for 19 h . After $1 \mathrm{~N} \mathrm{HCl} a q$. was added, the resulting mixture was extracted three times with EtOAc. The combined organic layer was washed with brine, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and then evaporated under reduced pressure. The residue was purified with a flash column chromatography (EtOAc/hexane $=1 / 20$ ) to give $\mathbf{1 c}-\boldsymbol{d}_{\mathbf{2}}(606 \mathrm{mg}, 75 \%)$ as a colorless solid: ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{TMS}$ ) $\delta-0.29(\mathrm{~s}, 9 \mathrm{H}), 2.37(\mathrm{~s}, 2 \mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H}), 7.09-7.17(\mathrm{~m}, 2 \mathrm{H}), 7.28-7.41(\mathrm{~m}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}(100 \mathrm{MHz}$, $\mathrm{CDCl}_{3}$ ) $\delta-0.8,19.3,54.7,68.1$ (quintet, $J=23 \mathrm{~Hz}$ ), 123.9, 126.8, 128.1, 128.9, 129.7, 130.9, 132.0, 138.2, 141.4, 142.4, 155.8; IR (neat) $3059 \mathrm{w}, 3026 \mathrm{w}, 2955 \mathrm{~m}, 2898 \mathrm{w}, 2853 \mathrm{w}, 2254 \mathrm{w}, 2139 \mathrm{w}, 1748 \mathrm{~s}, 1587 \mathrm{w}$, $1494 \mathrm{w}, 1442 \mathrm{~s}, 1281 \mathrm{~s}, 1249 \mathrm{~s}, 1194 \mathrm{~m}, 1155 \mathrm{~m}, 1062 \mathrm{~m}, 1040 \mathrm{~m}, 1002 \mathrm{w}, 926 \mathrm{~m}, 846 \mathrm{~s}, 790 \mathrm{~m}, 763 \mathrm{~m}, 734$ $\mathrm{m}, 706 \mathrm{~m} \mathrm{~cm}^{-1}$.

The general procedure A was followed with use of $\mathbf{1 c} \mathbf{c} \boldsymbol{d}_{\mathbf{2}}(50.4 \mathrm{mg}, 0.15 \mathrm{mmol})$ and $\mathbf{2 a}(46.6 \mathrm{mg}, 0.18$ mmol ). The reaction was conducted for 29 h . The crude product was purified with a flash column chromatography ( $\mathrm{EtOAc} /$ hexane $=1 / 10$ ) to give a mixture of $\mathbf{4 c}-\boldsymbol{d}_{\mathbf{2}}$ and $\mathbf{5 c} \mathbf{- \boldsymbol { d } _ { \mathbf { 2 } }}\left(57.3 \mathrm{mg}, \mathbf{4 c} \mathbf{- \boldsymbol { d } _ { \mathbf { 2 } }}: \mathbf{5} \mathbf{c}-\boldsymbol{d}_{\mathbf{2}}=12: 88\right.$, $85 \%$ ) as a colorless solid. $\quad \mathbf{5 c}-\boldsymbol{d}_{2}:{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{TMS}$ ) $\delta 2.31(\mathrm{~s}, 3 \mathrm{H}), 4.16(\mathrm{~d}, J=16.6 \mathrm{~Hz}$, $1 \mathrm{H}), 4.61(\mathrm{~d}, J=16.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.26(\mathrm{~s}, 1 \mathrm{H}) 6.98-7.44(\mathrm{~m}, 17 \mathrm{H}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 21.4$, 33.1 (br), 42.9, 55.2, 126.85, 126.88, 127.0, 127.35, 127.42, 127.44, 127.9, 128.38, 128.44, 128.9, 129.3, $130.8,133.5,136.9,139.7,139.9,140.8,142.9$; IR (thin film) $3060 \mathrm{w}, 3029 \mathrm{w}, 2254 \mathrm{w}, 1597 \mathrm{w}, 1495 \mathrm{~m}$, $1452 \mathrm{~m}, 1342 \mathrm{~s}, 1160 \mathrm{~s}, 1091 \mathrm{~m}, 1032 \mathrm{~m}, ~ 956 \mathrm{~m}, ~ 911 \mathrm{~m}, ~ 865 \mathrm{~m}, ~ 813 \mathrm{~m}, 783 \mathrm{~m}, 760 \mathrm{~m}, 733 \mathrm{~s}, 703 \mathrm{~s}, 679 \mathrm{~m}$ $\mathrm{cm}^{-1}$.

The resonances at 3.07 and 3.19 ppm , which is assigned to the 4-position of tetrahydroisoquinoline, disappeared from the ${ }^{1} \mathrm{H}$ NMR of the major product in the reaction of $\mathbf{1 c}$ with $\mathbf{2 a}$ (Figure S-34 or S-35 vs S-41). The observation indicates that the benzylic ester moiety of $\mathbf{1 c}$ reacted with the imino carbon of $\mathbf{2 a}$. Therefore, the major product is assigned to $\mathbf{5 c}$.

## Reaction of 1d with 2a (Table 2, entry 5).

The general procedure B was followed with use of $\mathbf{1 d}(40.8 \mathrm{mg}, 0.15 \mathrm{mmol})$ and $\mathbf{2 a}(46.7 \mathrm{mg}, 0.18 \mathrm{mmol})$. The reaction was conducted for 4 h . The crude product contained the cycloadducts $\mathbf{4 d}$ and $\mathbf{5 d}$ in the ratio 56:44, which was determined with the ${ }^{1} \mathrm{H}$ NMR spectrum (see Figure S-43). The crude product was purified with a flash column chromatography ( $\mathrm{EtOAc} /$ hexane $=1 / 20$ ) to give a mixture of $\mathbf{4 d}$ and $\mathbf{5 d}$ (42.4 $\mathrm{mg}, \mathbf{4 d}: 5 \mathbf{d}=58: 42,73 \%$ ) as colorless liquid: ${ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{TMS}\right) \delta 2.14(\mathrm{~s}, 1.2 \mathrm{H}), 2.15(\mathrm{~s}$,

The above reaction would proceed with the similar regioselectivity to the reaction of $\mathbf{1 f}$ with $\mathbf{2 a}$. The major product was assigned to $\mathbf{4 d}$ by comparing the mixture of $\mathbf{4 d}$ and $\mathbf{5 d}$ to that of $\mathbf{4 f}$ and $\mathbf{5 f}$ in their ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra (Figure $\mathrm{S}-44$ vs S-48 or S-45 vs S-49).

The general procedure A was followed with use of $\mathbf{1 e}(40.6 \mathrm{mg}, 0.15 \mathrm{mmol})$ and $\mathbf{2 a}(47.2 \mathrm{mg}, 0.18 \mathrm{mmol})$. The reaction was conducted for 48 h . The crude product contained the cycloadducts $\mathbf{4 e}$ and $\mathbf{5 e}$ in the ratio 43:57, which was determined with the ${ }^{1} \mathrm{H}$ NMR spectrum (see Figure S-46). The crude product was purified with a flash column chromatography ( $\mathrm{EtOAc} /$ hexane $=1 / 10$ ) to give a mixture of $\mathbf{4 e}$ and $\mathbf{5 e}(44.8 \mathrm{mg}$, $\mathbf{4 e}: 5 \mathbf{e}=43: 57,78 \%$ ) as colorless liquid. The major product was assigned with the NOE experiments. The ${ }^{1} \mathrm{H}\left\{{ }^{1} \mathrm{H}\right\}$-NOE experiment was summarized in Figure S-1, indicating that the reaction afforded $\mathbf{4 f}$ preferentially.
