SUPPORTING INFORMATION

## Experimental

Unless stated otherwise, reactions were performed under an argon atmosphere in flame-dried glassware. Tetrahydrofuran (THF), dichloromethane $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$, diethyl ether $\left(\mathrm{Et}_{2} \mathrm{O}\right)$, toluene $\left(\mathrm{C}_{7} \mathrm{H}_{8}\right)$, benzene $\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)$ and acetonitrile $\left(\mathrm{CH}_{3} \mathrm{CN}\right)$ were passed through Glass Contour solvent drying systems prior to use. Chemical reagents were obtained from commercial sources and used without further purification. Column chromatography was performed on silica gel 60 (240-400 mesh). Thin layer chromatography and preparative layer chromatography utilized pre-coated plates (silica gel $60 \mathrm{PF} 254,0.25 \mathrm{~mm}$ or 0.5 mm ).

## o-Xylylene diamine (B)

To a solution of o-xylylene dibromide ( $100 \mathrm{~g}, 378 \mathrm{mmol}$ ) in THF (1.3 L), EtOH (1 L) and $\mathrm{H}_{2} \mathrm{O}(0.33$ L) was added $\mathrm{NaN}_{3}(53.7 \mathrm{~g}, 826 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(0.33 \mathrm{~L})$. The solution was heated at reflux for 1 h . After cooling to $\mathrm{rt}, \mathrm{PPh}_{3}(248 \mathrm{~g}, 947 \mathrm{mmol})$ was added in small portions. When the evolution of $\mathrm{N}_{2}(\mathrm{~g})$ ceased, the solution was heated at reflux for 2 h . Upon cooling to rt and standing overnight, needle shaped crystals had formed, which partially dissolved with the addition of $100 \mathrm{~mL} \mathrm{H}_{2} \mathrm{O}$. Solid NaOH was added to the aqueous solution until a pink oily layer appeared. The organic layer was separated and the aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 50 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated in vacuo. The slightly pink oil obtained was used without further purification.

## 2, 5-Dihydro-3-(methylthio)-1H-2,4-benzodiazepine hydroiodide (9)

These procedures were carried out as described in Elslager, E.; Worth, D. F.; Haley, N. F.; Perricone, S. C. J. Heterocycl. Chem. 1968, 5, 609-613.

## Methyl 5-bromo-2-oxopentanoate (7)

A solution of lactone C ( $46.6 \mathrm{~g}, 249 \mathrm{mmol}$ - prepared according to Cushman, M.; Gerhardt, S.; Huber, R.; Fischer, M.; Kis, K.; and Bacher, A. J. Org. Chem. 2002, 67, 5807-5816. Note: the EtOH used was freshly distilled from Mg turnings) in $30 \% \mathrm{HBr} / \mathrm{AcOH}\left(150 \mathrm{~mL}\right.$ ) was heated at $110^{\circ} \mathrm{C}$ for 2 h . An additional 100 mL of $30 \% \mathrm{HBr} / \mathrm{HOAc}$ was added and the reaction maintained at $110^{\circ} \mathrm{C}$ for 14 h . The mixture was concentrated in vacuo to afford a brown oil that was dissolved in 250 mL MeOH . Concentrated aqueous $\mathrm{H}_{2} \mathrm{SO}_{4}(0.5 \mathrm{~mL})$ was added and the solution stirred at rt for 14 h . The reaction was concentrated and the incipient residue dissolved in $\mathrm{Et}_{2} \mathrm{O}$. Saturated aqueous $\mathrm{NaHCO}_{3}$ was carefully added until gas evolution ceased. The organic layer was separated and washed with $\mathrm{H}_{2} \mathrm{O}$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Concentration in vacuo provided a brown oil that was used without further purification.

## Methyl-1,4,5,6-tetrahydro-3-pyridazinecarboxylate (D)

16
Hydrazine hydrate ( 20.4 g , 398 mmol ) was dissolved in a mixture of $\mathrm{MeOH}(300 \mathrm{~mL})$ and water ( 37.5 mL ). Glacial $\mathrm{AcOH}(7 \mathrm{~mL})$ was added and the solution cooled in an ice-bath. A solution of crude 7 in $\mathrm{MeOH}(50 \mathrm{~mL})$ was added over 30 min wherein a white precipitate formed. The ice-bath was removed wherein the solids dissolved. The pH of the mixture was maintained between 4 and 7 with $3 \mathrm{M} \mathrm{aq} \mathrm{K}_{2} \mathrm{CO}_{3}$. After the pH had stabilized at rt , the reaction was immersed into an oil-bath pre-heated to $60^{\circ} \mathrm{C}$ and 3 M aq $\mathrm{K}_{2} \mathrm{CO}_{3}$ was used to adjust the pH to $\sim 5$. The reaction was heated at $60^{\circ} \mathrm{C}$ for 1 h at which time the pH was 6. After removing MeOH in vacuo, the residue was dissolved in a minimum amount of water and extracted with EtOAc. The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated to afford a solid that was recrystallized from EtOAc to afford 16 ( $42.5 \mathrm{~g}, 81 \%$ ).

The relative stereochemistry in 36a was assigned based on coupling constants and NOESY spectra. The 3.9 Hz coupling constant between H17 and H18 supports a cis stereochemistry. The correlations between $\mathrm{H} 10, \mathrm{H} 12$ and $\mathrm{H} 10, \mathrm{H} 18$ suggests these three protons are on the same face of the diazabicyclo[3.3.0]octane ring system. The small coupling constant between H11, H10 (J < 1 Hz ) indicates a trans relationship. This only leaves the quaternary center C16 uncertain.
