## 1. General methods

All chemicals were used as received unless otherwise noted. Reagent grade solvents $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$, hexane) were distilled prior to use. All reported NMR spectra were recorded on 500 MHz spectrometer. UV-vis absorption and fluorescent spectra were recorded in toluene. Chromatography was performed on silica (200-400 mesh). Mass spectra were obtained via EI or electrospray MS (ESI-MS). The following compounds were prepared as described in the literature: $\mathbf{1},{ }^{\mathrm{S} 1} \mathbf{9},{ }^{\mathrm{S} 2} \mathbf{1 0},{ }^{\mathrm{S} 3}$ and $\mathbf{S 1} .{ }^{\mathrm{S} 4}$

UV/Vis spectrophotometer and spectrofluorimeter were used to acquire absorption and emission spectra. Spectrophotometric grade solvents were used without further purification. For fluorescence spectra samples were excited at 530 nm .
