<sup>a</sup>Theoretical references were generated by FEFF7.

**Table SI2:** Structural Parameters Corresponding to Structural Model II for EXAFS Data Characterizing the MgO Supported Osmium Species formed by reductive carbonylation of  $Os_3(CO)_{12}$  on MgO at 548 K

Model	Absorber– backscatterer pair	Ν	R (Å)	$10^3 \times \Delta \sigma^2 (\text{\AA}^2)$	$\Delta E_0 (\mathrm{eV})$	${\epsilon_v}^2$
Model II	Os–Os	$4.5\pm0.9$	$2.89 \pm 0.02$	$8.4 \pm 2.2$	$-1.23 \pm 1.9$	4.9
	Os–C	$3.1 \pm 0.5$	$2.60\pm0.03$	$3.3 \pm 1.8$	$3.28 \pm 2.3$	
	Os–O*	$2.1 \pm 0.9$	$3.01 \pm 0.02$	$5.5 \pm 3.6$	$4.56 \pm 6.7$	
	Os–Mg	$1.0 \pm 0.3$	$2.65 \pm 0.01$	$-1.1 \pm 2.2$	-18.99 ± 8.9	

<sup>a</sup>The errors given in the table correspond to the precisions of the parameters. Notation: *N*, coordination number; *R*, interatomic distance;  $\Delta \sigma^2$ , Debye-Waller parameter;  $\Delta E_0$ , inner potential correction; the estimated accuracies of the parameter are as follows: *N*, ±20%; *R*, ±2% Å;  $\Delta \sigma^2$ , ±20%;  $\Delta E_0$ , ±20%.

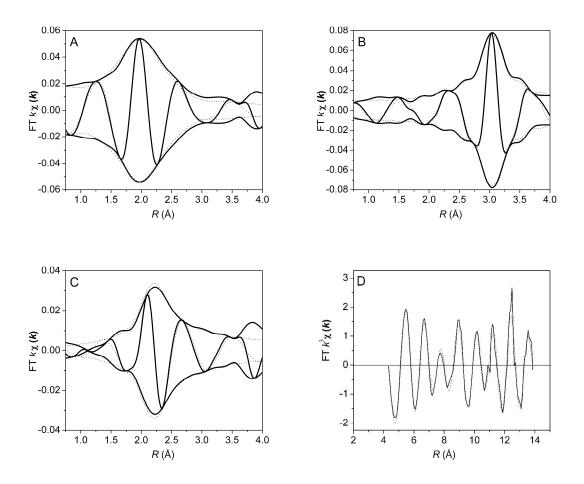

**Figure SI 2:** EXAFS data (Model I) characterizing species formed by reductive carbonylation of  $Os_3(CO)_{12}$  on MgO at 548 K: (A)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–C shell; (B)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated line) of Os–O\* shell; (C)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (C)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (C)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (C)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (C)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell.

**Figure SI 3:** EXAFS data (Model II) characterizing species formed from reductive carbonylation of  $Os_3(CO)_{12}$  on MgO at 548 K: (A)  $k^3$ -weighted EXAFS function,  $k^3(\chi)$  (solid line) and sum of the calculated contributions (dotted line); (B)  $k^3$ -weighted imaginary part and magnitude of the Fourier transform of data (solid line) and sum of the calculated contributions (dotted line); (C)  $k^3$ -weighted, phase and amplitude corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–Os shell; (D)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) (dotted line) of Os–Os shell; (E)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) of Os–C shell; (E)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) of Os–Os shell; (F)  $k^3$ -weighted, phase and amplitude corrected, imaginary part and magnitude of the Fourier transform of data (solid line) of Os–O\* shell; (F)  $k^3$ -weighted, phase and amplitude corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (F)  $k^3$ -weighted, phase and amplitude corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (F)  $k^3$ -weighted, phase and amplitude corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (F)  $k^3$ -weighted, phase and amplitude corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–Mg shell.

**Figure SI 4:** EXAFS data (Model III) characterizing species formed by reductive carbonylation of  $Os_3(CO)_{12}$  on MgO at 548 K: (A)  $k^{\prime}$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–C shell; (B)  $k^{\prime}$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (C)  $k^{\prime}$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (C)  $k^{\prime}$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (C)  $k^{\prime}$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (C)  $k^{\prime}$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (C)  $k^{\prime}$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell.

**Figure SI 4:** EXAFS data (Model IV) characterizing species formed by reductive carbonylation of  $Os_3(CO)_{12}$  on MgO at 548 K: (A)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–C shell; (B)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (C)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (C)  $k^1$ -weighted, phase corrected, imaginary part and magnitude of the Fourier transform of data (solid line) and calculated contributions (dotted line) of Os–O\* shell; (D)  $k^3$ -weighted EXAFS function,  $k^3(\chi)$  (solid line) and sum of the calculated contributions (dotted line).

**Example of EXAFS Data Fitting.** Described below, as an example, is the detailed analysis carried out for the data characterizing the sample formed by reductive carbonylation of  $Os_3(CO)_{12}$  on MgO at 548 K.

The initial data fitting with the plausible absorber–backscatterer contributions (Os–Os, Os–Os, Os–Og, Os–Os, Os–Os and Os–Os, Os and C represent the carbon and oxygen atoms from a carbonyl ligand) led to a narrowed list of to candidate fits (models I and II) on the basis of the goodness of fit. No fit including only a single shell (contribution) was adequate. Both the models found to be most successful in fitting the data included Os–Os contributions. Model I includes two Os–Os contributions, at 2.80 and 2.98 Å, with coordination number of 2.3 and 2.4, respectively, whereas model II included only one contribution, at 2.89 Å, with a coordination number of 4.5. Model I and II each includes contributions from carbonyl ligands, namely, Os–C and Os–O\*. All contributions were fitted with reference files that best represent the contributions in the measured sample.

Model I provides the best overall fit, and model II provides a good overall fit as well; however, the shell characterizing the Os–Mg contribution in model II was found not to fit well after the contribution was phase- and amplitude-corrected, showing unrealistic values for  $\Delta E_0$  (18.99 ± 8.97 eV). Furthermore, the Debye-Waller factors for the Os–Mg contribution was < 0, and these values are unrealistic. Of the two models, model I is the one that fits the data better with physically realistic parameters.
